If you shop for a new TV, then don't look any further. TechRadar brought together the biggest, brightest and smartest televisions to ever have passed through our eyeballs. Top performing TVs can be expensive, but you have to think of this as an investment that will return value over many hours and many years, and will benefit your whole family. Most of the 2020 TV series have not only arrived, so many of the sets below are from 2019, but don't let it kick you off. Upgrades between TV generations tend to be small steps, so you won't miss a huge amount by keeping with these models. Remember, all these TVs get software updates anyway over the internet. For now, you can choose safely to upgrade to one of these top performing TVs currently on the market. Is bigger better? We're going to pick up some of the best 65-inch TVs at a glance: Samsung Q90R QLED TVLG CX OLED SeriesBest 8K: Samsung Q950TS QLED TVBudget OLED: LG B9 OLED SeriesSamsung Q80T QLED TVLast YEAR, the Samsung Q9FN was the TV to beat. It won plaudits galore for its features and image quality, not to mention its excellent, improved smart platform that came with Bixby support and Samsung SmartThings. However, it was not perfect and there were legitimate complaints about angles and an over-aggressive local eclipse system that bruised detail just above black. Samsung clearly took this criticism at heart and addressed them directly in the Q90. The new model has a visible better viewing angle that keeps its own against an OLED TV, and the local eclipse delivers deep blacks without losing shadow detail. At the end, the new Ultra Black Elite filter is nothing short of a revelation, rejecting ambient light in a way that only scours faith. The Q90 is able to deliver images that can compete directly with an OLED, with natural colors, bright highlights, deep blacks, and well-defined shadows. It can also surpass any OLED when it comes to HDR, with images that are often breathtaking in their detail and dynamic range. In fact, our only real criticism would be that, unlike some of the competition, the Q90 does not support Dolby Vision. But in all other respects the Samsung Q90 is an absolutely star new Samsung TV that takes QLED to another level. Read the full review: Samsung Q90R QLED TV (Image credit: LG)The LG CX OLED is definitely the best OLED TV for 2020, and fully deserves to scrap the top of this list to the best TVs available today. Iterating on last year's LG C9 Series, the LG CX may not seem all that different - and it's not. But by proceeding the same enchanting picture quality and outstanding webOS smart platform, with some contemporary updates such as HDMI 2.1 and an a9 Gen 3 processor, it is managed to overdo its predecessor. With a new 48-inch OLED what is also available now, the CX is an even more flexible statement for a wider range of wallets and and With a sleek design and support for Dolby Vision and Atmos - along with bellowing built-in sound - it's a fantastic choice at any size. LG is really looking to attract gamers with its 2020 series, too, with rock-bottom input lag/latency, support for Nvidia G-Sync, and compatibility with 4K/120HZ game for next-gen consoles. You won't get HDR10+ here, unfortunately, and British viewers will have to go without all their favorite catch-up apps, but make no mistake - it's the best OLED TV for you in 2020.Read the full review: LG CX OLED (Image credit: Samsung)85-inch: Samsung QN85Q950TS | 75-inch: Samsung QN75Q950TSAwesome photo quality Standard setting HDRNo Dolby Vision supportsLimited 8K content The Samsung Q950TS represents the latest 8K TV of the manufacturer. Combining all the advantages of last year's Samsung Q900 8K screen with innovations first introduced the 2019 flagship Samsung Q90 4K TV that hit shelves earlier this year. Combined in one top-notch QLED TV, the new Samsung Q950 provides an 8K panel and AI enhanced image processing, plus wider look angles, an enhanced black filter and standard setting HDR performance. If all that wasn't enough, Samsung's smart TV platform is the most comprehensive on the market. So if you're looking for a state-of-the-art new Samsung TV - and don't care to pay top-dollars for it - the Q950TS should be at the top of your short list. Read the full review: Samsung Q950TS 8K QLED (Image credit: LG)55-inch: LG OLED55B9 | 65-inch: LG OLED65B9LG's cheapest 2019 OLEDRich colors and sharp detail Not the latest processingNo HDR10+ The LG B9 OLED delivers absolutely on its promise - to give shoppers a cheaper way in a world of OLED, with the sharp contrast and bright colors entailing. Inevitably there are some angles cutting to get there, and you don't get the excellent experience of the C9 or E9 - while the delayed introduction of the budget B9 model, and continued price cuts to more premium sets, meaning this year's B series isn't quite the deal it would have been a few months ago. If the B9 is all your budget allows for, it's a solid purchase, all scrimping and saving for the LG C9 OLED - and keeping an eye out for it in the Black Friday and Cyber Monday sales - could be a better decision in the long run. (Image credit: Samsung) New for 2020, the Samsung Q80T QLED builds on the successes of previous models for brilliant HDR TV definitely worth checking out. The most noteworthy feature is the incredibly low input lag, making the Q80T a great choice for gamers who want to react game, but the QLED screen will also generally check a pleasure around. The Q80T is the cheapest 2020 Samsung TV to come up with a full-scale background, which means you will get consistent brightness, although not some of the premium properties of higher-end sets - from there why it is lower on this list than the last country Q90 QLED. It's also not quite as stylish as the zero-bezel Q950TS, with a thick body compared to other QLEDs in this year's series. However, you still get Samsung's latest Quantum 4K processor, bright HDR colors and advanced smart TV features through the Tizen OS. If you want more of a savings, the Q70R QLED is this TV's predecessor, and you'll cost a good few hundred dollars less than the new Q80T model (yes, that's the product line, and yes, the nomination is confusing). Read the full review: Samsung Q80T QLED TVHow to buy What TV technology is best? What is the best LCD TV? Which screen size is best for your lounge? What is the difference between LCD and LED TVs? The answers are not always obvious. In fact, buying a new TV can be stressful, even for the technology-skilled - because there are so many brands, so many features, so many screen sizes, colors, technology and flavors to choose from. So which one is right for you, your family and your living space? In this guide we will walk you through everything you need to know about purchasing a new TV. What types of TV are out there? There are a lot of different types of screens out there, all working in different ways to produce the same results. Each technology has its own unique strengths and weaknesses, so here are some basics to consider: LED TV: Direct LED These shows are backslidden by a variety of LEDs (light that ray diodes) directly behind the screen. This enables localized eclipse - meaning instantly adjacent areas of brightness and darkness, can be displayed more effectively - and improves contrast significantly. LED VVS are also more powerful and capable of making a wider color spectrum than CCFL sets. Due to the extreme cost of mounting these arrays of LEDs, cheaper TVs usually use Edge-Lit LED screens about Direct or Full-Array LED screens. LED TV: Edge LED With these TVs, LEDs of the background are mounted along the sides of the panel. This arrangement enables radically slim exhibitions and offers better contrast levels to CCFL, but cannot achieve the same image quality as directly to the LED sets. However, they come in much cheaper which is why most LED TVs out there now use this technology. OLED TV The background on OLED (organic light that emits diode) is achieved by passing an electric current through an emissive, electroluminescent film. This technique produces much better colors and higher contrast and also enables screens to be extremely thin and flexible. This is the sacred grail display technology and LG, Sony, Philips and Panasonic have all adopted it in their flagship sets. Quantum Dot Quantum Dot is Samsung's great play in the LED TV space. With it, the brand claims that it is in to produce more colorful pictures than LG and Sony while offering even brighter panels. LG's Super UHD-UVs all use a variation of Quantum Dot called Nano Cell, and Hisense makes a number of Quantum Dot TV's TVs The US and China.Curved TV Some manufacturers are still making TVs that are slightly curved screens. But unlike old CRT TVs, the curve is inward rather than outside. The idea is that it makes every pixel equally far from your eyes, delivering a more satisfying picture. However, there are diss for this type of screen, the main one is that if you sit far enough on one side - more than 40 degrees or so - the curve clearly begins to influence the image's geometry, content near you shows and comums the image's center. What resolution technology should I go for? HD HD TVs come in two resolutions. Sets with the HD ready are required to be able to display a minimum 720p photo, and generally have a screen resolution of 1366 x 768 pixels. Meanwhile, Full HD TVs has a higher resolution of 1920 x 1080 pixels. It is highly advisable that you do not go for anything less than full HD in this day and age. Ultra HD and 4K The resolution of Ultra HD is exactly four times higher than full HD - 3840 x 2160. This means a much more detailed picture, with content relieving much more bandwidth and storage space. 4K TVs tend to be good on the upscaling HD video ultra HD, but there are currently very few options for watching native 4K content. Read more about 4K resolution.8K If 4K is not enough to impress you, there are now a good number of EVs entering the market. This ultra-ultra-ultra-high-definition format packs four times the number of pixels as 4K, for even sharper, criminal images. The problem is that there is little 8K content available - nothing on Netflix, for example! This means that these sets need highly advanced processing to make upscale HD or 4K content for 8K screens, and while it is not yet a must-buy technology, it is definitely where the TV market goes. Read more about 8K resolution. HDR Probably moving to HDR video can make a more dramatic difference to your watching experience than moving from HD to 4K. Like another HDR images, the moving version expands the range of both the light and dark points of spectrum, providing more detail for both. However, HDR needs new filming methods - at the moment there is no way to back up HDR in existing video. It also needs new TV technology, with Samsung the only ones to create specific screens, although LG and Sony will be able to update some of their existing stock to be compatible. Buying a flat screen television is a big investment and one you can't afford to take lightly. Just pop in the nearest store and grab the first plasma or LCD you see won't get you the best deal, the screen that suits your needs, or the gear you need to make the most of your new purchase. Size people tend to choose the size of their flat TV based on the amount of space they have for it, it not necessarily showing. Flat TVs take up much less space than you think, so your new TV can end foot or two further away from your viewing position, which makes the picture smaller. Also, with hi-def, you can have a larger screen and the same viewing distance without having to worry about seeing scars inherently to the source. A 4K TV's lack of noise means that the ideal distance to sit off the screen is three to four times the height of the TV. What size TV should I buy? How many HDMI sockets do I need? For a lounge TV you should be looking for a minimum of 3 HDMI inputs. If you want to attach a set-top box as well as games consoles, those HDMI ports will quickly fill in. (Image credit: iStock) Do I want to hang my TV on the wall? First, you should consult a construction expert to make sure that the demand for the wall is strong enough to support a flat screen. Then find out if the set you want is designed to be wall mounted and, if so, ask if the bracket in question is included in the basic package or as an optional extra. Will I connect it to a home cinema? If the answer is no, you might want to think more carefully about your set of audio performance. Look for a screen that can go as hard as you need without distortion or cabinet rattle. Consider how dialogue sounds and how much low-end litter the bark is capable of. On the other hand, this is senseless payout more cash for exceptional built-in speakers than you already have a decent home theater system. Other buying guides to check
