Photo: istockphoto.comLaundry day is probably not the highlight of your week, but a reliable, efficient washing machine makes the job much less tedious. If you replace an old, energy-saving appliance or buy a washer for a new home, you will need to decide between two main types: the front load against the top load. And clean dirty clothes, laundry and other washes, first whistling laundry through soapy water, then rinsing off soap, and finally spinning off excess moisture. But there are differences between the two types of pucks, the most basic of them is whether the door is on top or front. RELATED: 12 Laundry Mistakes You're probably makingAnother the main difference is the presence or absence of an agitator-post in the middle of a traditional top loader drum. Beating the action of the laundry against the agitator helps to loosen the dirt and oil, so that the detergent can easily remove it, but the agitator can be difficult on the clothes, leading to wear, tearing, and disappearing. Instead of agitators, front loaders get their battering action by tumbling laundry inside a rotating drum to help loosen stains and dirt. New High Efficiency (HE) top loaders are also washed with the agitator in favor of an impeller plate-low-profile rotator hub with a blade located at the bottom of the drum, which adds extra movement to the load without the fabric-beating action agitator. While most brand washing machine manufacturers offer both front and top-load machines, most Americans still prefer top forklifts, but not in favor of agitators. According to a survey by the Association of Home Appliance Manufacturers, 76 percent of the washing machines sold in 2015 were top loaders, and 52 percent of them were its models. However, the market for front loaders continues to grow. Read on for a head-to-head comparison-top load against the front load of the washer to fully understand the pros and cons of each one and ultimately make the best decision for your home. Photo: istockphoto.comFront loaders clean up on performance. When it comes to clean, fresh laundry, front-loaders outperform their top-loading counterparts in almost every consumer group study. As long as you don't overstuff the unit, tumbling through the air and water motion of the front loader allows water and detergent to effectively penetrate the fabric, thereby removing stains, odors, oils and other dirt more effectively than the back and forth canvassing the top loader. Also, front loaders are not that washers. Front loaders handle large loads. While both types of washing machines are available in a variety of capacities, including compact models suitable for small living spaces, full-size front-facing tend to have more power than full-size top loaders. The average top machine with an agitator can accommodate three to four cubic feet, while the average front loader has four four five cubic feet of space inside the drum. The average HE top loader falls somewhere in between. To put that into perspective, you need about four cubic feet to wash the queen-sized comforter. Before buying the largest capacity machine available, however, make sure it will fit in your laundry as the larger the capacity, the bigger the machine. Photo: istockphoto.comTop loaders are more ergonomic. It is usually more comfortable doing laundry with a top loader because you can get up straight to the machine, while you have to bend to reach inside the front loader. If you're worried about hurting your back but your heart is set on the front load of the puck, you can add some solace with the pedestal. These under-the-puck-and-dryer raisers add 12 to 16 inches of height to your appliances. Each manufacturer of front loads of machines offers this option (for an additional few hundred dollars), and most pedestals include a convenient laundry box. You will need to buy size pedestals to match your models of washer and dryer - this is a common addition when buying these laundry appliances. Top forklifts save money in general. While front loaders and HE top loaders are very energy efficient, thereby reducing the cost of their launch, you will pay a little more upfront for any of these types of machines over the traditional top loader, often a difference of several hundred dollars. In addition, the more high-tech electronics the model boasts, the more opportunities for something to fail. Normally you also pay more for front loader maintenance. One very common problem with these machines is the accumulation of mold and black mucus around the rubber pad that seals the door. You can help avoid this by regularly cleaning the pad, as well as leaving the door open after use so the machine can dry between uses. But if the problem develops, you may need to replace the pad. Overloading the front loader is also more likely to result in a visit from the repairman than overloading the top loader, like the front loader drum support suspension to fail under the strain. In terms of lifespan, the top loader is likely to last ten years or longer, while the front loader is less likely to make it up to the 10-year mark, assuming equal use and maintenance. RELATED: 8 appliances that cost you good luck in energy bills When it comes to noise and vibration, it's a draw. Machines with top load can be noisy, but if the load does not become unbalanced, they usually do not vibrate much during any of the cycles. The front load machines, on the other hand, do not Noise is behind the whirring sound, but can transmit heavy vibrations to the non-concrete floor, such as wood or vinyl, due to the super-fast spin of their drums. While newer forward load machines are less likely to vibrate, there is still a consideration as to if your laundry area is upstairs or you have wood wood Save a lot of time with a top loader. If you are in a hurry to get the laundry done, don't buy a front loader, which can often take twice as long to complete the washing cycle. This is because front loaders have a more complex wash cycle, with water coming into the drum and draining several times during the process, compared to top loaders that fill with water only once during the cycle. Some front loaders now offer time-saver settings to speed things up, but your clothes can't come out as clean when rushed due to reduced water exposure. Photo: istockphoto.comFront loaders use less water. One of the biggest advantages of the front load of the washers is their reduced water consumption. This is a significant difference: a typical top loader uses 30 to 40 gallons of water to wash and rinse laundry, while a typical front loader requires only 10 to 15 gallons for the same functions. His top forklifts are somewhere in the middle; they usually require 15 to 20 gallons of water per load. Less water not only means that your water bill will be lower, it also means it requires less energy to heat the water during a warm or hot water wash cycle. RELATED: 8 (Almost) Invisible laundry loaders use the space effectively. Almost every front load washer and dryer set can be stacked using a styling bracket. This means you can use full-size machines even in a confined space. You need enough space to open the doors, however, so be sure to include a comfortable swing room when measuring your available space. While you can find pre-stacked laundry towers with the top load washer at the bottom, these units are compact and are usually used in apartments or other living spaces with very limited space. On the cabin floors next month, you'll see new models with chrome accents, hydraulic loops, and doors that close with a solid, hard kick. No, we are not talking about car dealerships, but about salons of household appliances. The new Whirlpool washer and dryer (left) have performance and design features that take their cues from the high-tech electronics and automotive industries. What you will notice immediately is the soft, curved lines and chrome finish. Top-loading, high efficiency washer has a cover that works with barely a nudge. Just lift or lower it a bit and it opens or closes the rest of the path on its own, so there's no more fight when your Whirlpool hands are loaded with laundry. Close the dryer door and it sounds like the car door slamming shut. The control panels (see below) are full-color LCD touch screens and work Atm. You can create your own custom cycles for any items you want to wash and dry a certain way, and specialty cycles handle everything from stuffed animal swimwear to shoes. Built-in USB ports will allow you to download loops and programming updates when they become available and turn on/off or off Looks like it could come straight from your computer. And since it's still laundry we're talking about, both the washer and dryer boast features to save water and energy. While all this innovation isn't cheap (puck and dryer every \$99), I have to say they're lovely to watch and quite fun to use. At a press release last month, I had the opportunity to play with them a bit and they are definitely pretty cool. To start the washer, you must turn on the door switch on the front load of the washing machine, and the lock mechanism must be activated. Once it is determined that the door lock mechanisms are intact and that the door can remain closed, the next thing to do is to make sure that the lid switch has continuity that can be checked with a multimeter. Notes Part Select. In order to bypass the door switch on the front loader when diagnosing electrical problems, the power must be turned off and the front panel must be removed. If the switch does not have continuity, it must be replaced. The entire washer cabinet may have to be removed to gain access to the entire door switch mechanism to remove it, as Network notes. Individuals should remove the screws, take out the door switch assembly and remove the ground wire. They then have to replace the new door switch by tracking all the steps running backwards, putting the cupboard back and then plugging the puck to check it.
