All of this is managed by controls that can be very simple or quite complex. The controls tell the system when to release the detergent from the dispenser, when to extract water from the bathtub and pump it back through the system, when to rinse and remove the flushing of the water, and when to turn on the heating element. These spray weapons are usually both at the top and bottom of the tub, like a high pressure sprinkler system that sprays the dishes clean. Dirty water is collected at the base of the inner

chamber, passes through the filter and pumped back through the system during early washing cycles. When all cleaning and rinse cycles end, the pump sends dirty water through the drainpipe.
