The following table shows the characters included in the extended ASCII character set with their Unicode value. Any of these characters can be addressed using the hexadecimal notation of HTML & #; x; ..., along with the Unicode hexadecimal value: for example, the copyright sign © whose Unicode code is U+00A9 can be written & copy; (©) or & #x00A9; (©). This will be displayed in the lower-right corner of the character map utility. To use this shortcut, hold down THE ALT key while you type the entire code. When you release the ALT key, the glyph appears. This only works with the numeric keyboard on desktops. On some computers, this will only work if Num Lock is enabled. These codes may not work with laptops, notebooks or portable computer devices, etc., depending on the machine: most laptops have an additional blue fn key, and small blue numbers on the 789uijklm keys.. - if you have these, you can use ALT + Fn, and then the small blue numbers on these keys to get the same effect. There are two sets of ASCII characters/codes (pronounced ASS-kee). Standard ASCII characters are a set of digital codes that represent each letter, number, and various symbols in the English alphabet. It is mainly used in computers to communicate text between applications and systems. ASCII is an abbreviation for the American Standard Code for Information Interchange. The standard ASCII code was originally designed to include only 128 characters. The table below is the expanded ASCII character chart. Click here for the Standard ASCII chart.
