Usb foot pedal gaming

Why do I need a gaming pedal? The idea and general benefit of using your feet to add more control to your computer should not make much of an explanation: you can perform two or more functions on your feet, freeing your hands and fingers for other tasks. Adding pedals to a racing or flight sim setup can make you feel authentic, but more importantly, it just makes it easier to use. Look outside the world of gaming and computers and we see this additional utility used for all kinds of walking life. There are sewing machine speed pedals, guitar effects pedals, pedal keys organs, kick drum pedals – the list goes on and on. Heck, even some software comes with crank control. Take a quick search online for PC foot pedals and one of the most common results is pedals specifically designed for use in dictation software. The guestion isn't really why you need a gaming pedal, but why on earth are we not all already in them? The list of possible uses is close to endless. Even one pedal that repeats a single-key press can allow push-to-talk communication to be activated in your favorite game chat app or open game inventory. Double up on the number of pedals and you could unload the run and crouch keys or use them to lean left and right. Go all out and you could use multiple pedals to select weapons, fire off macros and much more, all without having to move your fingers from the most important keys and buttons on the keyboard and mouse. Add analog pedals to the mixture, and you have even more options. Well, so using here may be less game oriented, but having a pedal that can adjust the volume, scrolling speed / direction and so on could definitely be helpful. Opportunities, given all this potential, you'd expect gaming peripheral businesses have long cottoned on to this cash cow and milked it dry. However, one well-known peripheral company has not yet been found. It's pretty bizarre. This means that there are still some options you'll see to pop up is Fragpedal, made by good work systems. Built with gaming in mind, Fragpedal has access to two-pedal or four-pedal versions, and it certainly looks like it has potential. Unfortunately, we couldn't get hold of one of this feature as a small US company has yet to ship to the UK. With this promising option no-go, we found only two programmable USB foot pedals that proved widely available worldwide. Both seem to be made by a Chinese company called PCsensor (software configuring both pedals made by that company), although they are marketed under the Sodial brand only £20 inc VAT (it is listed as FS3 PCsensor software). The second can also be found amazon.co.uk under the Docooler brand, with a single pedal version (FS2016USB1) costing £18 inc VAT and a two-pedal Docooler. After a reliably short Amazon delivery time, both pedal boards arrived unsalted - clearly both products were stocked in the UK. Quickly download the configuration software from PCsensor.com and we were able to give the pedals a workout. Straight, it was clear that docooler pedal was much stronger than the Sodial one. It has a thick metal base that makes pedals both durable and heavy enough not to fly around the floor. The foot switches themselves are also large, heavily torn and give a clear audible click when triggered. In contrast, sodial pedals have a flimsy plastic base, and the pedal only with the tip of your feet. This arrangement was annoying enough that we flipped the pedals around and used them with a USB cable directed at us. The buttons also do not provide any kind of sound or tactile feedback when they are triggered. Setting up both sets of pedals was really easy though. The software clearly lists all the products it supports down on the left side, and it automatically shows which ones are connected to your computer. Select a device, and you can assign either one key to each pedal, a mouse button click, a series of keypresses, a multimedia key function, or even a button to resemble a game controller. You can also choose to press the key one or continuously. Pedal on metal Having found that we much prefer Docooler pedals, we used them as our main test subject to see just what supplement pedals produce in our gaming. We tested them in three main configurations. The first was with the left pedal on the map for a push-to-talk and the right pedal assigned to bring up the in-game card. In other words, we used them only for small-scale, casual functions. We tested this configuration across several games. Next, our testing became a bit more game-specific, and we set up pedals for use in Apex Legends. This game requires you to almost constantly hold down the left pedal to see how well it happened to a much more constant use. The correct pedal was assigned to push to talk. Finally, we configure the pedals for use in PlayerUnknown's Battlegrounds, where we used them for bending left and right. If you've ever played a first-person shooter who is leaning into control, you know it can be hard full wasd movement, running/walking/crouching control, mouse target and bending. Compensating the latter on the foot pedals, it would be much easier to get other movements right. Returning to our first scenario, the pedals easily proved their worth here. A simple, casual raw material that is uncritical is where it's easy to feel comfortable relying on cheap no-name foot pedals, and you don't need particularly neat feet either. However, it was immediately clear that having two separate pedals placed further apart, where they sit naturally under their feet, would be much more desirable for a single two-pedal board. Unfortunately, with the appearance of PCsensor software, this setting may not be possible because it only lists each pedal once. However, you may be able to use the fs2016USB2 and single-pedal FS2016USB1 combination. Meanwhile, the second scenario quickly showed that the FS3 pedals weren't up to work because the switches just didn't seem to be as reliable when kept permanently. FS2016USB2 picked up well though. You can just relax your foot on the pedal and basically never let it go - especially if you choose a continuous trigger input that will cause the key to press again, even if the element of the game forces you to stop running. The pedal seemed to hold up the malicious prolonged pressing and worked like a charm. Finally, we come to the leaning challenge, which is if the whole world foot pedal exercise takes on a different skill level and learning – this was also where we most missed having two pedals more spaced out. Using both legs accurately and safely, and coordinating them with keyboard and mouse movements, took some exercises, and we certainly didn't master it in a week or so we tested the pedals. However, we saw potential. With the right hardware properly created, the foot pedal setup seems like a natural progression of game control. Can I create my own? As we've mentioned, none of the big-name brands have engaged in this potentially big market yet, which is perplexing. Once we've seen such specialized, expensive gaming mice, keyboards, headphones, steering wheels and joysticks, it's hard to imagine that there aren't enough niches to market foot pedals too. Either way, though, that's the situation right now. If the above couple of examples don't take your fancy, or want a more sophisticated pedal setup, the only other option is to make your own. We're still working on our own DIY pedal board, so we don't have a full build guide yet, but the theory is pretty simple. Grab a little fleeting switches, or premade pedals, install them on the board, wiring them in the Arduino and typing a short bit of code, card each button press for the keyboard function. If it's done correctly, you shouldn't need extra power and you could just run the board out of usb power supply. We managed to grab four fleeting switches, an Arduino and slab plywood all under £40 – you can look for our complete build guide for a later issue. In the meantime, if you've ever experimented with foot pedals gaming – or if you've made your foot pedals – get in touch and badgering our favorite PC peripherals to start investing in controllers that allow us to make the most of all our limbs. Strengthen your gaming while using advanced quality input usb foot pedal gaming and have an additional chance to take even more action per second to compete even to win.
