With Android System WebView, you don't have to leave the app to open links. This program serves as a mini-browser and allows you to view outside sources quickly and conveniently. Android System WebView is an Android system component that serves as a quick link viewer through apps on your device. Powered by Google Chrome, the Android System WebView app acts as a miniature version of the browser. With it, you can open links through the apps you use. You will find Android System WebView installed on most Android devices by default, which means it is safe. As such, this tool helps especially those who browse social media applications or develop software. Mini-browser offers all the features of a real solution, including scrolling and searching for text. As mentioned, the application will be preinstalled. If you don't like it, you can disable it through settings. However, performing such an action may cause some applications to fail. Also, it's a job remembering that you'll need Android System WebView updates to make it run smoothly. Where can you run this program? This program runs exclusively on Android devices running version 9.0 and later. Is there a better alternative? Yes. If you are a Chrome user, then this web browser can do the same for you. There's also an extension called Chrome WebViewer that can handle it. For iOS users, the WebView user interface is a good choice. Once you have Android System WebView installed, it can make it easier for you to use apps. Should you download it? Yes. Such a tool will make your phone more useful if you can save mobile resources and patience for recording. Download Windows only: Windows System Information is a freeware system tool that allows you to view system configuration in almost every conceivable aspect of software, hardware, and network configuration. There are many applications that cover similar SIW territory, but this is by far the largest conglomeration of tools in one small, simple executable that I've seen. SIW can provide you with details about every hardware on your system, a list of license information for installed programs, and a (frighteningly) list of all stored firefox usernames and passwords and Internet Explorer, and provide you with an overview of network traffic and network applications. This Swiss army knife system information is freeware, windows only. SIW - System information for Windows Does your download folder constantly get cluttered with old files that you don't even remember downloading? Sure, you can always just delete the contents of the folder and start over, but a better way is to teach your computer how to clean it for you. For this task we will use a small freeware called Belvedere, which can move or delete files based on custom rules that you can easily set in the interface. To get the full benefit of automatic cleaning, you should also set up a great CCleaner cleaning app that starts automatically every night.   Using Belvedere After downloading an executable file and saving it to a safe place, you can simply run it and get to work (without the need for installation). If you want the app to start automatically when you sign in, you can create a shortcut in the shell:startup folder. The first thing you'll want to do is click on the plus symbol in the lower left corner to add a new watch folder. Next, you'll want to select a folder in the logically named Folder Viewer dialog box. After you add a folder, you'll want to select it on the left... Then click the plus sign below the Rules box to create a new rule that gives it the appropriate name as Clean up old downloads. The interface allows you to create multiple conditions to match the files, but since we are trying to clean the old files to download, you can choose the date of last open and not in the last x days, which is quite easy to understand. you may want to send the file to the recycle bin rather than just delete it, and you can further refine the filter by adding a new rule plus, and enter Extensions and match one of them, and then insert file extensions in a comma-separated box (don't use a period). The Test button shows you what files will match, so you won't make a big mistake. Once you're done with that rule, you can create a completely different rule that matches different files... for example, I created a rule to move all downloaded images to the Pictures folder. After you create all the rules, you can minimize the application on the system taskbar and it will work silently in the background and after you will clean up. It's not a perfect app and definitely has a few bugs (so use the trash option instead of deleting it), but overall it's a great app to keep your system cleaned up.
