Control raspberry pi with android phone bluetooth

Bluetooth headsets use close-range wireless technology to connect to your Android phone, allowing you to talk hands-free from up to 8 meters away. When you first connect a bluetooth headset to an Android phone, you'll need to configure it using the headset PIN. This PIN is a number that helps your Android device connect to the correct device. If you're having trouble connecting headphones to your phone, you might be using an incorrect PIN. On the Android phone home screen, tap the Settings icon. Tap Wireless networks. Tap the List of Bluetooth headphones in the list of devices. Type the new PIN when prompted during the device setup process, and then press OK to pair the headset and Android phone. At \$35, Raspberry Pi is a fantastic little computer, but when you add a cost display, mouse, and keyboard, things get a little more expensive. Good thing you don't really need them. With VNC, you can access your Pi from your laptop or desktop computer using the same mouse, keyboard and display that you always do, no rewiring required. Step One: Download VNC Viewer for your Windows or Mac ComputerYou have many different options for VNC software, but we've found that VNC Viewer is the easiest to use that works well with Raspberry Pi. From your PC or Mac (and iPhone or Android, for that matter), head over to RealVNC's VNC Viewer, click the Download your operating system button, then download the free app. Step two: Start VNC Server Using SSH or TerminalVNC server is included with the latest version of Raspbian, PIXEL, so all we need to do here is the startup server. If you are using an older version of Raspbian or another operating system at all, this guide by Raspberry Pi Foundation shows you how to download and install it. We assume you want to set up VNC because you don't have access to an additional display, mouse, and keyboard. So, the best way to do this is to use Secure Shell (SSH). SSH allows you to control your Raspberry Pi using the command line from any computer. To do this, you must do this to start the VNC server for the first time. Power up your Raspberry Pi and connect it to your router with an Ethernet cable. Download and install Adafrit's Pi Finder for your operating system. When the download is complete, run the app and click the Find My Pi button. Pi Finder will search for Raspberry Pi on your network. Let it do its thing. Eventually, it will show your Raspberry Pi IP address. Make sure that the user is set to pi, and the password is set to raspberry (assuming you haven't changed them from default, that is, otherwise enter your credentials), then click the Terminal button. It logs you raspberry pi command line where you can start a VNC Server that comes packed with your Pi. At the command line prompt vncserver and press Enter. Enter. runs the command and starts vnc server Raspberry Pi. At the end of the command you will see a note similar to the one image above that says: The new desktop is raspberrypi:1 followed by a number that includes the Pi IP address, for example (192.168.0.19:1). Write down this number, you need it to log on to the VNC server from your computer. Now that the VNC server is running, you can log on to it from another computer. Raspberry Pi's main operating system, Raspbian, just got a brand new look from Raspberry Pi Read moreStep Three: Log Into VNC Server from your PCNow it's time to log in to that VNC Server: From your PC or Mac, double click on VNC Viewer application to download in the first step. In the VNC Server box, type the number that you made the note in the previous step, such as 192.168.0.19:1, then click Connect.Enter pi for the user name and raspberry password, and then click OK. Within seconds, VNC Viewer should display its Raspberry Pi desktop environment. Now you can control your Raspberry Pi just as if you were sitting right in front and using the keyboard, mouse, and monitor connected to the actual Pi. Step Four: Set VNC to start automaticallySury want to go through the process outlined in the second step every time you want to use your Raspberry Pi, you want to set the VNC Server run automatically boot. It's very easy to do: In Raspberry Pi desktop environment, click on the Terminal icon to open your command line. Type sudo raspi-config and press Enter.Use the arrow keys to scroll down to Advanced Options and press Enter.Scroll down to the VNC server and press enter. This is it, now VNC Server should start to automatically boot. Once the VNC is set up, you can use your Raspberry Pi just like the other computer no matter where it is connected. VNC is incredibly useful if you own only a laptop and don't want to buy an entire accessory kit just to use your \$35 Raspberry Pi, or if you only need access to the user interface for short moments on the project and don't feel like going through rigamarole fix all the time. Whether you're a computer player or a mobile player, there are some games that just play better for the controller. The mouse and keyboard may be more accurate, but are cumbersome for use with limited space or on the couch. Bluetooth controllers hit that sweet spot between the two. But not all Bluetooth game controllers are created the same way. Some of them are designed specifically for Android devices, while others are genuine console controllers that run on all platforms, such as the Xbox One controller. To help you make a decision, we have created a list of the best Bluetooth controllers for Android and computer games. Looking for more mobile accessories? We have a guide on it! Best Bluetooth game controllers: Gamesir T4 ProRazer Raiju Controller8bitdo SN30 Pro 28bitdo M30Editor note: We will update this list of the best Bluetooth game controllers regularly as new devices launch.1. Xbox One Bluetooth controller Xbox One Bluetooth controller is fantastic all around whether you play gaming on a laptop, pc, Mac or Android device. Plus, if you're on console gaming you might already have one. There is a reason why many other options in the rest of the list look like Xbox controllers. The design is tried and true. It feels great in your hands with excellent control sticks and responsive triggers. The D-pad for the newer Bluetooth version is much better than the original Xbox One controller, but retro games or fighting games might have better options. The Xbox One Bluetooth controller takes two AA batteries and lasts about 40 hours. You can also invest in a more environmentally friendly Xbox One Play & Charge Kit that doesn't quite last for 30 hours. It also features a 3.5mm jack right at the top of the controller. 2. The Xbox One CoreWhile Xbox One game controller may be what is known, the Xbox One Core controller is an insight into the following locations. It's still in the pre-custom stage, but the Core controller is what you couple with the new Xbox Series S and Series X when they start. See also: Xbox Series X vs S: Which next gen console is the one for you? At first glance, it resembles the current controller, but small differences have the potential to make a huge difference. For starters, the D-Pad is rounded to resemble that luxurious Xbox One Elite controller. It should offer a better answer than the simple four-way pad it replaces. Microsoft also reworked the buffer and triggers by adding stippled texture to better adhesion in the center of the operation. We don't yet know how the Xbox One Core controller's battery life will stack up, but it's hard to imagine many changes from the previous generation. It retains the same 3.5mm headphone jack as well, and the controller features an all new sharing button. After all, gaming is more connected than ever, so you have to show off your highlights.3. Sony DualSenseThe Core Bluetooth game controller has a look at the future of xbox, but Sony DualSense controller is what you couple with the new PlayStation 5 when it launches. It retains some of the same design nuances of DualShock's past controllers, but the new DualSense looks more like a spaceship than anything else. See also: Sony PlayStation 5 buyer's guideOne of the biggest changes that accompany the new generation is a white controller. Most of the previous DualShock options are back directly out of the box, but DualSense is designed to match the PS5 itself. For other important changes, DualShock rocks the adaptive trigger setup, which means you will feel different responses as you do different parts of your environment. Sony DualSense also keeps a 3.5mm headphone jack and a built-in microphone to chat with friends. There's a Create button to help you share content and live on your favorite streaming platforms. For better or worse, you won't be able to simply replace AA batteries and keep playing – the controller charges only via USB-C.4. DualShock 4 PS4 controller If you don't plan to pick up a PS5, you may not need to jump into the DualSense controller right away. Instead, you could possibly stick with a reliable DualShock 4 controller and choose from over a dozen colors. A simple look at dualshock 4 and you know it's a PlayStation controller. It sports the same look and feels you're accustomed, packed with headphone jack, touch panel, and more. If you're a mobile or computer player, it's great to pick up DualShock 4. Of course, this may not be such a smooth transition if you come from an Xbox background. Sony refined its fourth generation DualShock controllers with sensitive triggers and even better stick control. The built-in light bar is another unique feature, although it doesn't do much beyond the atmosphere of your gaming sessions.5. SteelSeries Stratus DuoThe SteelSeries Stratus Duo has a rechargeable battery that is rated 20 hours. It is also significantly less colorful, with a taded all-black look. Stratus Duo is a lightweight and easy-to-carry Bluetooth game controller. In addition to working with Bluetooth, Stratus Duo can connect with a 2.4GHz wireless connection in Windows and Steam. This is great if your desktop computer doesn't have Bluetooth— just plug in the supplied USB wireless adapter. Check out our full SteelSeries Stratus Duo review below for a more detailed look, but we found the device to be excellent for both mobile and computer gaming. The only major complaints were the lack of USB-C charging, which is monitoring in 2019, and a slightly sentimental D-pad. The marking of the buttons is also quite difficult to read, because of the gray-on-black color scheme. Read also: SteelSeries Stratus Duo review: Best premium mobile game controller Stratus Duo is best paired with a phone tripod or SteelSeries SmartGrip when playing games over the phone. It's significantly lighter than Stratus XL at 245 grams, so it's a more portable choice for gamers on the go.6. GameSir T4 ProThe GameSir T4 Pro controller is Bluetooth compatible, but it also has a 6.5 cable if you want to use it wired. Its ergonomic design is nice in your hands, playing for a long time. T4 Pro is a cheap, ergonomic controller for pc players. There is an asymmetrical vibration motor with five different speed levels to help improve your gaming experience. You will feel every accident or explosion. You stay immersed in the game. You also have the option to adjust the engine vibration intensity if you want a more muted gaming experience. Aside from being ergonomic, the design of this game controller is really cool. It has a semi-transparent cover so you can see the inner workings of the controller. Then, from the outside, both the D-pad and the right joystick LED backlit. If it's too bright, you can adjust the intensity of led lighting. This Bluetooth game controller is designed specifically for Windows 10, 8.1, or 8.7. The GameSir T4 Pro controller has a GameSir MCU chip that provides a faster response and higher overall performance when playing.7. Razer Raiju Mobile Controller If you're lustng for more premium Bluetooth controller mobile gaming, try this one from Razer. Razer Raiju Mobile Controller brings all the calls and whistles you'd expect from a high-end Bluetooth controller and then some. It is made of top quality materials and textured plastic that feels great in hand. This is one controller you don't want to sedu. Check out our full review below. Read also: Razer Raiju Mobile controller has an amazing (ly) expensive) layout and the design controller is very similar to the Xbox One, with the added feature of the built-in phone clamp. It has a rechargeable battery that rated 23 hours during the game, two USB-C cables for charging or a wired connection to the phone, and a hair trigger switch to get these footage off even faster. It is the most feature-packed Bluetooth controller on the mobile gaming list, but also the most expensive. In our testing, the controller himself performs flawlessly. The only problems we encountered were related to the support of the mobile game controller, and even this has been partially eliminated by button mapping and other issues in razer's special mobile-associated circle. As the mobile gaming market develops, it is expected to improve naturally.8. 8BITDO SN30 Pro 2The 8BITDO SN30 Pro 2 is compatible with Nintendo Switch, Android, Windows, macOS and Steam. And while it looks like a retro controller, it has all the features you want from today's Bluetooth gaming controller. You can use a controller using Bluetooth or a direct USB connection. Even better, the SN30 Pro 2 comes in a variety of colors to match classic consoles like GameCube and Nintendo 64. The SN30 Pro 2 has a retro controller with all modern Bluetooth controller features. It has a full set of buttons, including home and screenshot buttons. It has clickable joysticks, rumble vibrations, and even motion control. For something that looks as retro as it is, it really packs a punch in terms of functionality. If you're craving old school feel retro controllers, but don't want to sacrifice modern technology, this is a great opportunity. Check out: 15 best retro games 8BITDO M30So you're looking for a Bluetooth game controller to use with Sega Genesis, this is it. The controller is also compatible with Nintendo Switch, PC, macOS and Android, but it is designed with Sega classics in mind. You can play Sega classics with modern features like USB-C port and turbo functionality mapping. The M30 is the best Bluetooth, retro-looking controller for Sega Genesis Fans.Its ergonomic design fits comfortably in your hands, allowing you to play for hours at a time without having to take a break. Both the D-pad buttons and shoulder buttons feel good and are very responsive.8BITDO's M30 controller is a great, inexpensive retro controller. This is a particularly good solution for fans of sega genesis console who want a Bluetooth controller with modern features. Even if you don't have Sega Genesis, the controller is still nice to hold and easy to play with.
