The extension page provides details about why you need this information. There are a couple of options available to you when it comes to your Android device ID. If youTake a phone call, start dialer#8255 and call the phone. If the displayed data is scrolled down and displayed below the JID entry that lists the email addresses, the device ID is displayed in hexadecimal format. We are interested in the 16 characters that appear after 'android-' if you have a tablet - you can do this on your phone but you need to download the device ID from Google Play. If you try to download an app for side-loading on your Android phone, you're going to know how confused the app is. In many cases, there are several versions of the same app designed for different device specifications, so is there a way to know which one is correct? This is a great option if the app you need is geographically restricted, isn't available on your device, or has updates that haven't been applied to your account yet. You may need this information to download from XDA developers or other sources. Related: How to sideload an app on Android can be tedious if you find yourself trying to figure out the right download for your phone. If your app has only one version, but you have an app that has more than one version available, you don't have to worry about this (for example, There are 40 variations on YouTube). This is if you need to know the best version for your phone. In general, the details are divided into three main categories: Architecture: This refers to the type of processor on your phone. Typically, the options are arm64, x86, x86_64 option. ARM and x86 are for 32-bit processors, and arm64 and x86_64 are for 64-bit processors. We're looking at it in more detail below. Android Version: This is the version of Android OS on which your device is running. Screen DPI: DPI stands for dots per inch, which is basically the pixel density of the phone's screen. For example, a 6-inch Full HD screen (1920x1080) has a DPI of 367. Bump x resolution from 2880 to 1440 and raise the DPI to -537. Technically, when you refer to pixel density, the correct term is PPI, orPer inch. But apk mirrors (and others) call this DPI, so we stick to relative terms. ARM vs x86 Android version and DPI are pretty easy, but the processor architecture is a completely different story. I'll do my best to break it down as easily as possible here. ARM: This is the first mobile processor architecture, and most phones are currently running. Qualcomm's Snapdragon, Samsung's Exynos and MediaTek's mobile chips are all examples of ARM processors. Most of the latest chips are 64-bit, or ARM64. x86: This is the architecture specification of the Intel chip. Just as Intel is dominant in the computer market, these chips are not very common on Android phones. x86_64 refers to a 64-bit Intel chip. This information is especially important because x86 and ARM files are not compatible with each other. Similarly, if you have a 32-bit processor running on your smartphone, the 64-bit APK will not work. However, because 64-bit processors are backward compatible, 32-bit APKs work correctly on 64-bit processors. I know how to find the correct information about your device, I know, it's a mess. The good news is that there is an easy way to find all the information on your device in an app called Droid Hardware Information. This is a free app in the Play Store and essentially will tell you everything you need to know about your phone. Go ahead and give it, install and start it. Here's where to find exactly what you're looking for. The first tab to display is the Devices tab, which opens by default. Here are two important information: DPI and Android OS version. To find the DPI, check the Software Density entry in the View section. For information about Android versions, see OS versions under the Devices section. This will explicitly display the version number. For architectural information, go to the <a0> System </a0> tab, and then review the <a1> CPU Architecture </a1> and <a2> Instruction Sets </a2> entries on the <a3> Processors </a3> tab. This is not explicitly arm64 or similar, so it's not as stride-forward as others, so you'll need to read a little bit between the lines. First, if you see 64 in the architecture name, you can pretty much guarantee that it is a 64-bit device. It's easy enough. For ARM or x86, let's take a look at the instruction set section. In my Pixel 2 XL (screenshot above), for example, it is clear that it is an ARM64 device. However, the Nexus 5 is not so clear: I know it's ARM, but it doesn't explicitly appear as a 32-bit processor. In this case, you do not specify a 64-bit architecture, so you can safely think of it as a 32-bit chip. Which one do you want to choose?To download with <a0> in mind, let's go back to the YouTube example above.</a0> Looking at many versions of YouTube in APK Mirror, I'm going to find out exactly which download applies to my Pixel 2 XL. With device information in hand, run a 64-bit ARM processor, have a DPI of 560, and run Android 8.1. It is easy to match the processor type and Android version - arm64 and Android 5.0 or later. However, there is no specific option of 560dpi. Therefore, there are two main options: DPI, which is the highest available DPI, in this case 480, or nodpi. In this case, we recommend that you use the nodpi variant because it contains all the resources available to cover the DPI gamut. So why not choose this regardless of the file size, because it basically contains resources for working with any DPI, which greatly increases the size of the file. If you can find an exact match for your device's DPI, be sure to go with that device. Otherwise, you can choose the one that is a little higher and OK. However, in our test case, we are not sure that the 480 DPI version looks as good as the nodpi download because the phone is 560 DPI. In that case, the larger the file size, the more valuable the trade-off. It is very easy to learn the ins and outs of the device. Fortunately, once you understand this information until you get a new phone, you won't have to worry again. Phone.
