When buying a new iPhone 8, we know how important it is to make sure you can get the device up and running without fuss. Accessing the iPhone 8 User Guide, you will be given answers to all your questions, whether it's just looking for basic startup instructions, help on how to insert a SIM card, help with connecting your phone to WiFi, or more technical aspects of phone settings such as linking existing email accounts to a new phone. This user guide allows you to confidently and securely customize your iPhone 8 to maximize functionality. The following guide reflects the iPhone 8 running on iOS 11 and gives you a complete idea of how to get the best out of your new phone. iPhone 8 User Guide and Instructions for iOS 11 (PDF Based) This is the official iPhone 8 user guide and PDF instructions in English provided by the manufacturer. Download... Download the iPhone 8 User Manual PDF (10.42 MB) Another fantastic addition to Apple's best-selling line of smartphones, the iPhone 8 was first shown to the public on September 12, 2017 along with the highly anticipated iPhone X at the Steve Jobs Theater at Apple Park campus with a release date set for September 22, 2017. The natural successor to the iPhone 7 and iPhone 7 Plus, the iPhone 8, combines previously proven technology with brand new features to create an improved version of everyone's favorite smartphone. The design itself is not too different from its predecessor; However, the iPhone 8 boasts the addition of a glass back, wireless charging, faster processor and inevitably, dramatically improved camera and display technology. The bulk of the internal hardware is common as the iPhone 8, iPhone 8 Plus and iPhone X, meaning that it's less of a difference you'll need to pay close attention to when buying a phone. Recent additions to the iPhone family have received mixed reviews, with the best compliments of difference made by a new, faster processor and a useful addition of wireless charging. But, while the convenience of charging is something to get excited about, many have been left feeling that it's not enough to compensate for what is perceived as an aging, over-used design. Moving forward, a complete design overhaul certainly has to be something for tech giants to consider if they want to silence their critics. After all, the sale is often done initially by aesthetic appeal, and if the aesthetic appeal does not stand out from what the person already has, is there a need for updating? That aside, the iPhone 8 remains an improvement on what was before it. Key things to note from iPhone 8 Instruction Guide While Previous iPhone Owners Won't Notice Any Sharp In the process of installing for 8, the user manual is incredibly convenient, especially for new customers. What's more, it gives existing users updates on the basic functionality of their device, as well as allowing them to better explore new add-ons. The user's guide provides an in-depth guide to setting up your iPhone, expanding, advising and troubleshooting information, providing not only a useful source of information for the phone's initial installation, but also providing a focal point for the designation if you have any other issues as you become more familiar with the phone. The first thing to consider when setting up a new iPhone 8 is how to insert a SIM card. To be able to use basic features such as network services, calls and text messages, it's important to make sure that this is the first thing you do. So once you've ensured that you've reached the correct SIM card for your phone, then you can learn how to insert a SIM card into your iPhone 8 here. Completing the Apple Custom Master One thing that Apple always seems to excel at provides the user with a fantastic, easy-to-use customization wizard once you've got your phone charged, pasted a SIM card and you're ready to go. The iPhone follows this tradition well, ensuring that the user is well informed at every stage of the process. This bridges the gap between the phone being ready to turn on and your phone ready to use so once you're ready to go, just turn on your phone and follow the instructions on the screen. Apple will guide you all the way and allow you to fully understand all the basic functions of your phone. It may be a bit lengthy, but it will give you a real understanding of how your phone works and its key features. If you have any doubts about how it works, you can of course turn to the user's guide that will help you along the way! Another important handmade book for the iPhone 8 Internet Connection One of the key functions of a smartphone is its ability to use the Internet. So making sure that your iPhone 8 is online ready is very important. As long as your SIM card is activated and properly credited, you should find that you can use the card's networking features quite easily and very quickly to find yourself connected to the Internet. For many, WiFi plays a huge role in getting the best out of your smartphone, so by following these simple steps, you can quickly get yourself connected: Click on the settings. Click on the WiFi icon. Click on the Wi-Fi network you want to connect to. If this applies, please enter security passwords. For many apps such as Facebook, Twitter and Instagram, internet connectivity is important, so making sure you have a connection and turning it is of great importance. Linking email accounts to a phone where you can Accessing them with ease is something that needs to be reviewed as quickly as possible. By quickly adding your main email account, it allows you not only to access your email, but also to link your account to various apps that you can download, creating a more efficient user experience. Once you've mastered the aforementioned aspects of the setup, you'll find that your iPhone is not only ready to use, but easier to use, and you'll be able to get the best of what the phone has to offer. However, you still need to study the iPhone 8 user manual as recommended for you to be able to use it properly. Are you struggling to take beautiful photos with your iPhone 8 Plus camera? Capturing incredible images of an iPhone may seem difficult, but it's actually easy to get the hang of the hang. In this article, you'll learn how easy it is to control your iPhone 8 Plus camera. And you'll leave with the ability to take stunning iPhone photos that will satisfy you for years to come. Content Table: iPhone 8 Plus Camera FeatureClick any title link below to go straight to this section of article:1. Open the camera quickly for a quick photo2. Activate the grids for well-designed photos3. Use volume controls to take photos unobtrusively4. Choose shooting mode to create the best photos5. Include portrait mode for beautiful portrait shots6. Focus manually for Tack Sharp Images7. Expose by hand to capture the perfect detail8. Activate HDR to capture highly contrasting scenes9. Use a telephoto lens to get closer to your subjects10. Include live photos to record special moments in time11. Use Self-Timer for Hands Free Shooting12. Use blast mode for incredible action shots13. How does the iPhone 8 Plus camera compare to other iPhones?1. Close the camera quickly for a quick PhotographyDo you are not able to capture beautiful photos because you can't get your iPhone camera app to open fast enough? If so, you don't have to worry anymore. Because there are actually three quick ways to open the iPhone 8 Plus camera. First, you can quickly open the camera from the lock screen without even entering the password. Tap the power button or the Home button to reach the iPhone 8 lock screen. Then swipe left. The camera will open, ready for action. It's a fantastic way to get those split-second, once-in-a-lifetime shots. Second, you can open the camera from the Control Center.Access Control Center on your iPhone by swiping up from the bottom edge of the screen. A set of icons will slide up - it's the Control Center. Look for the camera icon in the bottom right corner. Choose a badge Open the iPhone Camera. Does it matter how your iPhone screen is used at the time (e.g. whether it's on the lock screen, on Netflix, etc.)? Fortunately, no! You can pull up the Control Center no matter how you use iPhone.Third, you can open your iPhone camera in the classic way: from the camera icon on the home screen. Just click on the icon to access the Camera app. To do this quickly, I recommend placing the camera icon on the dock at the bottom of the home screen. How do you put the camera in the dock? It's pretty simple! Tap and hold any home screen icon. In a minute the icons will start shaking. Drag the camera icon to the dock. Finally, click the Home button so you don't shake the icons. Now you know three quick ways to open your camera on the iPhone 8 Plus. You won't struggle to get those spurts-in-the-moment shots anymore. You can quickly open the iPhone camera, and the results will show in your photos!2. Activate Gridlines for well-composed PhotosDo do you want to instantly improve your compositions? Then use the camera grids. Camera grids are a set of lines that divide the screen into thirds, as shown below. Camera grids make it easy to use the rule of thirds, the fundamental principle of composition. The third rule helps create stronger and more spectacular images. According to the rule of thirds, it is best to place your horizon lines along one of the grid lines. The same goes for your main theme: place it along one of the grid lines. If you can place your item at the intersection of two lines (known as connection points), even better! But how do you activate the grid lines? To turn on the grid lines, select the settings icon on the home screen. Scroll down and click on the camera. Then choose the Grid option. That's it! Now you can effortlessly use the rule of thirds in your photos. And your compositions will immediately improve. To create more pleasant images, align your subjects with grids and connection points. Activating the grid lines will help you do this and you will really take your compositions to the next level. Use volume controls to make photos unobtrusivelyDo you sometimes want to be able to take photos without attracting attention? If so, you'll love this trick. You see, there are actually two simple ways that you can take pictures with the iPhone 8 Plus camera- without even touching the shutter button! Make sure you have the camera app open. Then tap any of the volume buttons on the side of your iPhone to take a photo. You can also take a picture with built-in volume control on Apple headphones. First, plug in the headphones to your iPhone. You need wireless headphones that come with your iPhone 8 Plus. Then press either the volume up or the volume down button to take a photo. This trick is fantastic when you are photographing strangers, or even people who are camera shy. If photographing in public, you can pretend that you are accidentally listening to music when you are actually snapping beautiful pictures! Using volume volume to howly the shutter, you will be able to go unnoticed by everyone around you. You will be able to take photos quietly and unobtrusively. You will be invisible, but your photos will be stunning. Choose shooting mode to create the best photos8 the number of iPhone 8 Plus shooting modes can seem overwhelming. You open the camera and you see a number of options all over the bottom: photo, portrait, square, pano, etc. But what do they all mean? And how do you choose which one to use for beautiful iPhone 8 Plus photos? I have some good news for you: 95% of the time, you can keep the camera in photo mode and you'll be able to capture stunning images. This should be your go to camera mode. But what about other modes? How do you use them to make stunning images? Square mode cultures field of view so you can take square photos. This can be great for making images, especially more abstract images. However, it is usually best to work in Photo mode and simply trim the photo squared later. This is due to the fact that Square reduces the resolution by cutting the photo in advance, and this change is irreversible. Time-Lapse allows you to record a special type of video with your iPhone camera. It takes a number of photos over a period of time and creates videos. When you play it back, you will see the scene changing over time. It can be great when you want to capture a video of a subtly changing scene. Pano mode allows you to take beautiful panoramic pictures. This is extremely useful for photographing very wide or very high scenes. To take a panorama, put your iPhone in Pano mode. Then press the shutter button. Once you have released the shutter, you have just started taking your panoramic photos. Smoothly panning the iPhone throughout the scene, following the instructions on the screen. To finish the panorama, just click the shutter button again. Video mode allows you to take high-quality videos from your iPhone. Once you're in video mode, click the shutter button. To finish recording the video, click the shutter button again. Slo-Mo allows you to make slow motion videos. Just click the shutter button to start recording and then again when you're ready to stop. This creates a video that plays in slow motion. Try it for a fun effect! Finally, the last camera mode is Portrait mode. This mode is designed to depict high-end portraits. I'll explain how to next section. 5. Turn on portrait mode for a beautiful portrait ShotsiPhone Portrait mode takes incredible, high quality portrait photos. When you take a photo in Portrait mode, Apple's software blurs the background. This allows your theme to really pop off the screen, and you have pictures that look like they came from a high-end DSLR camera. To use portrait mode, your main object must be less than eight feet and no closer than two feet. Make sure you position your subject item that they fall within that range. Before you take a picture, you can choose the portrait lighting option if you want. However, you can also install Portrait Lighting after shooting (you'll learn how to do it at the end of this section). Portrait Lighting allows you to apply different studio lighting effects to your photography- all using camera software! To choose the option of portrait lighting, swipe through the icons of the cube at the bottom of the screen. The default option is Natural Light. This does not apply to the real effect of lighting. It simply allows you to take a photo with the help of available lighting. Use this option if you are happy with your natural lighting situation. The second option is Studio Light. As shown below, this effect changes your photo, increasing the brightness of the subject's face. This is a subtle way to make your portrait photos pop. Another version of portrait lighting is Contour Light, which darkens the shadows around the face. Stage Light puts the spotlight on your subject and darkens the background as if your subject was illuminated on stage! And Stage Light Mono is the same as Stage Light, but it converts your photo into black and white. One interesting thing about portrait mode is that it is always possible to change the mode of portrait effects on your photos. You just have to open the image in the Photos app and click on Edit.From here, you can scroll through the different portrait lighting options and choose the one you like the most. Or you can remove the portrait mode completely by clicking on the word Portrait at the top of the image. Portrait mode and portrait lighting can be great for improving the quality of your portrait photos. They can make your portraits pop out of the page. So the next time you plan to take portraits, go ahead and try Portrait Mode!6. Focus by hand for Tack Sharp ImagesDo Do you often find that your photos are blurred? One of the common culprits of blurred photos is incorrect focus. Basically, your camera can only keep a limited amount of space in focus (this is called depth of field). Thus, the camera must decide which part of the scene should be sharp. In the picture below, the flowers are sharp while the background is blurred. Notice the limited depth of field; the iPhone camera is unable to bring everything into focus. If left on your own device, the camera tries to get well most of the time. But problems arise in certain situations. When there are a few items in the scene, your iPhone can't focus on the right one. This can cause the wrong items to be blurred! Also, when focusing on a very close topic, the iPhone camera may have trouble deciding which part focus on. This is when it becomes vital to use manual focus. But how to use manual focus? Fortunately, it's easy! When you're compiling an image, tap your finger at the area of the subject you want to appear sharp. You'll see you see a square appears around your finger, indicating exactly where the camera is focusing. And that's it! You're done. Your camera will be concentrated where you sent it. To refocus, just tap your finger elsewhere on the screen. You can also go further with manual focus with the AE/AF lock. This allows you to fix the focus at a specific location. Once the AE/AF lock is activated, the focus cannot be changed. To activate the AE/AF lock, just click where you want to focus. Then hold on until the words AE/AF Lock appear at the top of the screen in yellow. To disable the AE/AF lock, tap again on the screen. Or to block the focus elsewhere, click and hold anywhere else on the screen. The AE/AF castle is particularly useful in street photography. When you find a beautiful urban scene, you can block the focus in advance with the AE/AF lock. Then just wait until the man enters the scene before clicking on the shutter. The person will act as the perfect focal point, and your image will have the perfect focus! If you want to improve the sharpness of your photos, manual focus is a great option. In fact, I use manual focus all the time- it's a quick way to make sure your camera is focused on the right place!7. Expose by hand to capture a perfect DetailTake moment to look around the room. Look into some dark corners, take a look at some bright lights. Can you see them all clear? Can you design the details? You probably can. Unfortunately, your camera is more limited than your eye. The camera is not able to look at the scene with very bright elements and very dark elements and snap a flawless photo. It can't easily make light and darkness in the same image. Instead, when faced with a high contrast scene (i.e. very light and very dark, such as in the image above), the camera must choose what to expose. That is, it must decide the level of brightness of the image. If this makes the scene bright, the shadows will be perfectly exposed. The viewer will be able to see a beautiful level of detail. However, the highlights will be too bright and will not be short of detail. It's called overexposure. The opposite can also happen. The scene can be underexposed, so the glare is perfectly displayed. But the shadows will be black and lacking in detail. Typically, the iPhone camera does a decent job of deciding how to expose for an image. But sometimes you may find that the photo on the screen looks too bright or too dark. How do you deal with it? You use manual exposure. Click on the part of the image you want the camera to focus on. A small symbol of exposure (in the form of the picture below) will appear. Just swipe up if you want to image. Swipe down if you want to darken it. And watch in real time as the exposure changes! By exposing the action manually, you will prevent underexposure and overexposure. You'll make sure that the most important parts of the images are clear and detailed. And you'll keep getting beautifully exposed photos. Activate HDR to capture highly contrasting scenes: You might think it's impossible to easily photograph highly contrasting scenes. But have you tried HDR settings on your iPhone? HDR means high dynamic range. Simply put, this applies to photos that include details in both shadows and highlights. Using the HDR settings on your iPhone allows you to take more open, more detailed photos. The photo below was taken without HDR. Notice how the brightest parts of the sky are completely overworked without any color or detail. The next photo was taken with HDR. HDR photography captured in detail both in the bright and dark areas of the scene. How do I activate HDR? First, make sure you turn off the automatic HDR camera function. Go to the home screen. Click on the settings, then the camera. You'll see the possibility of Auto HDR deactivating. Click on him. While in the camera settings, you should also make sure that you have to keep the normal photo on. This acts as a backup. If you're not happy with your HDR photo, don't worry: Your camera will be saved as an HDR and non-HDR version. Now open the iPhone camera and look at the top of the screen. The HDR icon must be present. Click on this icon, then select On to make HDR yellow. You'll also notice the Auto HDR option. If you choose this, the iPhone camera decides whether to use HDR. All in all, I don't recommend it. Why? It drains the battery of your iPhone. When you're photographing a highly contrasting scene, turn on the HDR settings yourself. HDR is fantastic for shooting high contrast scenes. Use it when photographing a sunset, bright light or an object with a bright sky behind it. However, the HDR setting doesn't work well when you're trying to record action photos. To capture HDR photography, the iPhone camera actually takes three images. He then mixes them together, taking the best pieces out of each image. To do this, the iPhone camera makes one picture after another. Fast-moving objects will move from photo to photo. This means that any action in the scene will look a little blurry. This effect is called a halo, and it's best to avoid it in your photos. But the HDR feature works well in other situations, and is fantastic for capturing highly contrasting scenes. Use it when you want to depict beautiful details in both glare and shadow. And a Telephoto lens to get closer to your subjects! can be a real struggle to get closer to your subjects. For example, if you're trying to take pictures of animals, you can't get a hard shot using a wide-angle Camera. You'll need an iPhone 8 Plus telephoto lens here. The telephoto lens is designed to zoom in on the scene so you can get those in-your-face shots that you you dreamed. The default lens on the iPhone 8 Plus is a wide-angle lens. So, how do you activate the telephoto lens? Simply open the camera and tap the 1x icon to the bottom of the screen. And a vial! Your camera will shoot with a telephoto lens. To return to the wide-angle lens, tap the 2x icon at the bottom of the screen. When can you use this lens for stunning images? The telephoto lens is great for photos of pets and pets. Use it to get a powerful close-up. The telephoto lens is also fantastic for shooting people without actually disturbing them. Finally, the telephoto lens is great for taking close-ups of colors and interesting textures. You can get close, very close-close enough to capture the breathtaking details. However, it is best to avoid handholding the telephoto lens in low light conditions. This is because the iPhone 8 Plus telephoto lens does not have optical image stabilisation. What does that mean? Optical image stabilisation is a technology that stops you from taking blurry photos when the light is low. It's great for taking portable photos when you're taking at night. While the wide-angle lens on the iPhone 8 Plus uses optical image stabilisation, the telephoto lens doesn't. So when shooting in low light, either use an iPhone tripod or switch to a wide-angle option. In short, when photographing animals, strangers, portraits or close-ups in a good light, use a telephoto lens. This will allow you to get closer without causing any discomfort to your subject.10 Turn on Live Photos to make your photos come to life! This photo is always enough to capture a special moment! The photo freezes the scene in time, but it does not stop movement. He doesn't record the sound. Enter Live Photos. The Live Photos, which lets you take a picture, but when you open it in the Photos app, the image will be live. If you click and hold the image, you will be shown three second video clips containing the footage before and after the capture. It even contains a sound! Live Photos are perfect for recording those special moments with family, or those times spent walking alone in nature. It is these live photos that you really treasure years later. How do I turn on Live Photos? Open the camera and select the Live Photos icon at the top of the screen. When Live Photos is active, the icon will turn yellow. However, the fun has just begun! Once you've taken your Live Photo, you can change it using live photo effects. Find your picture in the Photos app. Then swipe up to open the effects panel. You should see four options: Live, Loop, Bounce, and Long Exposure.Tap option if you want to show your Live Photo on a continuous loop. Choose the bounce option if you want to display Live Photo moving forward and then back again. Choose the Long Exposure option if you want to mix your live photo in one long photo of the exposure. It's great for photographing moving water or flowers in the wind. Try to keep the camera completely calm, placing it on a tripod or stable surface. What if you want to share your live photos? First, you want to convert your real photo into a video. Then you'll be able to share it on different platforms. You can make your photos come to life with Live Photos settings. Turn on Live Photos the next time you're experiencing time is really worth remembering. Use Self-Timer for loud shooting! You may encounter situations where you want you to be able to take pictures without holding your camera. For example, you can take a self-portrait. But how do you do that? You use the iPhone 8 Plus self-ura gentle timer. This feature will allow you to hold up the shutter. And it gives you the seconds you need to walk into the frame. How do I turn on the timer? At the top of the screen, select the Self-Timer icon. Then select the shutter delay: three seconds (3s) or ten seconds (10s). When you press the shutter button, the countdown will appear on the screen. When the countdown is complete, your camera will take a number of images. As mentioned above, a self-timer is great for taking self-portraits. It's also great for taking group shots. Just set a ten-second timer, place the iPhone on a tripod or against something solid, and walk into the frame. So, the next time you want you to have someone to take a picture for you, never be afraid! Just pop out your iPhone, choose the self-timer option, and take some hands free photos!2. Use Blast mode for the incredible action ShotsYou're photographing action-filled scenes, but things are moving so fast. You're struggling to keep up. How do you take the perfect image? You use splash mode. Blast mode is one of my favorite features of the iPhone camera. This allows you to quickly make a series of shots: explosion. This ensures that you nail all your action photos. How do you use Splash mode? Simple: You press and hold the shutter button. The camera will continue to take photos as long as your finger holds the button. When you watch a spike in the Photos app, click Select at the bottom of the screen. This will open the blast and allow you to scroll through a series of photos that you have taken. You can choose the best images. Your iPhone will remove the rest. So the next time you need to take a picture, use splash mode. Your keeper rate will be greatly improved!13. How does the iPhone 8 Plus camera compare to other iPhones? You may be surprised: Is the iPhone 8 Plus camera good enough? Should you get an iPhone 8 instead? Or buy one of the new iPhones? In this section, I give you The iPhone 8 Plus camera is compared to the iPhone 8. I also compare the iPhone 8 Plus camera with the new iPhone offerings: the iPhone X camera, the iPhone XR camera, the iPhone XS camera, the XS, iPhone XS Max camera.13.1 iPhone 8 Plus vs iPhone 8 Camera have good news for you: iPhone 8 Plus camera is better than iPhone 8 camera. It's that simple. What makes me say that? A couple of things. First, the iPhone 8 Plus has two lenses, a wide angle and a telephoto. But the iPhone 8 only has a wide-angle lens - a lens identical to the wide-angle lens of the iPhone 8 Plus. The iPhone 8 Plus also offers a portrait mode that the iPhone 8 lacks. So the iPhone 8 Plus gets you every bit of the camera that the iPhone 8 has, and packs telephoto and portrait mode as bonuses. As you know, the telephoto lens is extremely useful for street photography, portraits and close-up photos. And portrait mode can enhance your portraits even more. So choose the iPhone 8 Plus over the iPhone 8.13.2 iPhone 8 Plus vs iPhone X Camera For those of you thinking about buying an iPhone X camera, I have bad news: Apple discontinues the iPhone X.You can still buy the iPhone X from other retailers or the used market. But why do it when you have so many other options? Apple recently announced three new iPhones, all packing new powerful cameras: the iPhone XR, iPhone XS, and iPhone XS Max. 13.3 iPhone 8 Plus vs iPhone XR Camera The iPhone XR comes with a new and shiny camera. In many ways, this promotion on the iPhone 8 Plus.First, the iPhone XR camera sports a better sensor than the iPhone 8 Plus. This is especially important for night photography when low quality sensors produce very noisy and unpleasant photos. With the iPhone XR camera, you'll be able to shoot better low-light images compared to the iPhone 8 Plus.Second, the iPhone XR offers a new form of HDR photography: Smart HDR. This allows you to take HDR photos of moving objects. The ghost effect that is present in the iPhone 8 Plus HDR photos will be removed. Now you can capture beautiful, detailed images of highly contrasting action scenes. Third, the iPhone XR provides an updated portrait mode. This will allow users to control the level of background blur. You'll be able to make more creative decisions when taking portraits that pop off the page. Finally, the iPhone XR has a bigger screen than the iPhone 8 Plus. This means that it will be easier for you to view the camera. And you'll have an easier time editing your photos. Unfortunately, there is one major drawback of the iPhone XR camera, and it's great. The iPhone XR does not have a telephoto lens. For me, it's a deal breaker. The telephoto lens on the iPhone 8 Plus is fantastic for capturing close-up images of people, plants and portraits. This is a big improvement over one wide-angle lens. As I mentioned, the iPhone XR still has portrait mode. But he doesn't use a telephoto lens for that. Instead, Apple's new technology blurs the background one-cornered lens. Although it's a cool new feature, it just doesn't take the loss of a telephoto lens.13.4 iPhone 8 Plus vs. iPhone XS Camera (and XS Max) Let me start by saying that the iPhone XS camera is indistinguishable from the iPhone XS Max camera. The only difference between the two options is size. The iPhone XS Max has a larger screen than the iPhone XS. So, if you prefer more screen real estate, you'd be better off with the iPhone XS Max. If screen size isn't something you care about, the iPhone XS camera will do the job just fine. Both of these variants have larger screens than the iPhone 8 Plus. And both of these options have the best cameras. Like the iPhone XR, the iPhone XS and XS Max offer high-quality sensors, Smart HDR and updated portrait mode. All these are exciting advances in iPhone camera technology. Unlike the iPhone XR, the iPhone XS and XS Max both sport identical dual camera lenses. But they offer an updated set of lenses on the iPhone 8 Plus. On the one hand, the iPhone XS and XS Max have optical image stabilisation. This is in contrast to the iPhone 8 Plus, where only a wide-angle lens offers this technology. This improvement will allow users to take sharp portable photos in low light with both wide-angle and telephoto lens. And the iPhone XS and XS Max also have faster telephoto lenses than the iPhone 8 Plus. What does that mean? Basically, XS and XS Max telephoto lenses can take in a bigger light. Like optical image stabilisation, it's great for shooting in dark situations. It's fair to say that the iPhone XS and XS Max camera is a significant upgrade in relation to the iPhone 8 Plus. While the iPhone 8 Plus camera quality is impressive, it just can't match the power of the XS and XS Max. What iPhones to check out, especially if you need to take shots in the low light. Click here to learn how to take incredible photos of the iPhone XS. Click here for the rundown iPhone XS vs. iPhone XS Max camera. This does not mean that the iPhone 8 Plus camera is out of date. If you don't want to take on the cost of a new iPhone, don't worry. You can still get fantastic images with the iPhone 8 Plus! Plus!
