For years, the Android community has been shouting at dark themes in apps and the system throughout, all while Google has continued to slam more and more white topics mostly everywhere. Slowly but surely, however, we are seeing more of Google's dark mode applications in tons of apps and services. Here's all of the Google Dark Mode app available today, including Android, YouTube, Calendar, Chrome, and more. Before we get into apps that support dark mode, why do we even care about it so much? Much of this comes down to personal preferences, as many users simply prefer the appearance of a dark interface. In the last hours of the day, a largely dark theme also helps with eye strain. A huge plus on Android, too, is that, as Google has clearly confirmed, it can save battery life big time. The reasons for apps to take a dark theme are on from there, and we're glad to see Google's dark mode finally arriving on apps. This list contains every Google app that currently has a dark mode, and the list will be constantly updated as new ones are added. If we missed any, drop the comment below and let us know! Google's dark mode

update app 5/19 Google App was one strange omission from this list of apps that support dark mode. In May 2020, this finally changed as Google officially announced the rollout of dark mode for its app on Android and iOS. The deployment began on May 19 and is said to be arriving for all users during the week. For Android 10 and iOS 13 users, Google's app follows the theme of the system for dark or light mode. For older versions of the OS, however, there is still a way to cause changes. Just go to the tab for more of the set-up of the common theme. From there you will be able to switch between dark and light. YouTube TV Dark Mode Update 5/19 YouTube TV corresponds with the video sharing platform it got its name from adding dark mode in April 2020. Android users on the latest update from the Play Store can touch the profile picture and then click The Settings for a dark theme to include the theme. For those on Android 10 and above, the setting should follow the switching system too. Google Play Store Dark Mode One of the last major apps lacking the official dark mode after the Android 10 update was the Google Play Store. Since October 2, the deployment of an update on the server side has begun to give the app a dark theme for all users. As usual, the dark mode for the Play Store uses dark gray instead of true black, and it respects the Android 10 switching system. Remarkably, there is no manual switching for the dark Play Store mode. Google Voice Mode Google Voice took its dark mode just as the month of October kicked off with the 2019.40 version. It also began rolling out through the Play Store just a few days later. The default dark mode on Google Voice follows the theme of the Android 10 system, but the same functionality functionality rolled out on iOS or web apps just yet. In the Android app, you can access the dark mode by heading into the settings of the theme. Google's Dark Mode Google's own cellular service, Fi, has seen some big changes recently including a proper unlimited plan. Another of these changes is the dark mode in the Android app, which began rolling out in early October. The design syncs with the default Android 10 theme and uses a conventional dark grey look instead of pure black. The dark theme for Google Fi also extends to the app's home screen widget and all four tabs, including store and support. You can go to the app's theme settings to customize the manual switch. Google Duo Dark Mode Camera apps don't usually get extensive dark mode, but Google video calling app Duo recently added dark mode support on Android. This of course means that you will see a dark gray theme in the settings as well as when searching for contacts, but it will not affect the call interface itself. Users can manually access this switch in the settings to select a theme. By default, it follows the theme of the system on Android 10. Google Recorder Dark Mode As part of our huge collection of Pixel 4 leaks over the past few months, we were able to share for the first time Google's new voice recorder app that debuts with the new phone. As a system application, it certainly also supports a dark theme. Under the settings of the set-up, you can choose from dark or light themes and, by default, it follows the entire switch system in Android 10. It's a dark grey theme as usual that extends to the player and the main menu, too. YouTube Dark Mode One of Google's apps tops the dark YouTube trend mode. The world's largest video service added the official dark mode to the internet and iOS app a few months ago, and it finally arrived on Android recently as well. Once flipped, YouTube's dark mode doesn't use a true black theme, but the same gray hue we've seen in other Dark Google apps. The theme extends to almost every section of the app and desktop website from comments to menus and more. On the desktop, you can switch the feature by clicking on the profile icon of the dark theme of the toggle On. As of October, there is also evidence that Google is delivering support for the system theme on Android 10. The upcoming Android Messages Dark Mode Google Android Messages app has quietly become a hub for many of the company's new initiatives, and it was one of the first with dark mode. The dark message mode also covers most apps, including the main interface, individual messages, and menus. Many accent colors change when going from white to dark, but it looks good anyway. Switching is as easy as accessing the three menu points in messages and clicking turn on the dark mode. Beta update at the end also finally added support for Android 10 to the whole theme system for the dark mode app and removed the manual switch from the overflow menu. Gmail for Android and iOS Dark Mode One of the most anticipated dark mode additions to Google's portfolio was Gmail, and it finally happened for iOS and Android apps. Rolling out on September 24, Gmail's dark mode beats all users on Android and iOS for about two weeks. The app respects Android 10 and iOS 13 systems throughout switches to a dark theme, like many other Google apps. The Android app, at least, also has a manual switch for functionality if users prefer to stick to either light or dark modes at all times. Google Assistant Dark Mode While elements of Google's app such as Discover have been dark mode for some time, the main app and Google Assistant lacked a dark color scheme. That changed in late September as beta users of Google's Android app began citing a dark theme in the app. The dark theme for the Google and Google Assistant app responds to system themes on Android 10 as well as Android Pie, but can be manually adjusted in the app's settings. Stay tuned for more details as the dark theme makes its way to a stable channel. Previous Android 10 Dark Mode As we've seen through various betas, Android 10 has dark mode as one of its biggest features. This dark theme is applied through virtually the entire system, including notifications, the Settings app, and also affects many apps on the device. As you'll see elsewhere on this list, many Google apps respond to this system throughout the switch and change their themes. Slowly but surely, many third-party apps are also adding functionality. To include a dark Android 10 theme on your Pixel smartphone, just explain the notification shade and tap the Dark Theme switch. If it's not, you can also go to the settings of the display and look for dark themes to switch there. A limited dark theme is also available on Android Pie. Here are some third-party apps that support the dark themes of Android 10 to switch files Google Dark Mode Originally developed as an app for Android Go smartphones, Google Files has evolved into one of the best file managers on Android. In a recent update, the app added support for a dark theme that uses a mixture of dark gray and pure black. The theme affects the entire application and can be caused by a system dark theme. In addition, there is a manual switch in settings for Google files. Google's Go Dark Mode Gallery Light Go Family apps now include a version of Google Photos. Gallery Go launched in late July and took its topic in an update just a few weeks later. Version 1.0.2 of the app provides a dark theme that respects the theme of the Android 10 system as well as manual switch in settings menu. Google Fit Dark Mode In Google Fit v2.16 for Android, the company has put a dark mode to give a break from the stark white theme the app has always used. The new theme can be applied manually through the app's settings, and it will also respect the system setting in Android 10. Like most other Google apps, it's not a pure black theme, but a gray color that also sees a green and blue color accent lightened to better match the dark background. Google Photos Dark Mode One of the most popular consumer services Google has never had photos, and along with the arrival of Android, the app is becoming a dark topic. While this doesn't affect any of your photos, Google Photos dark mode gives a gray background like many other Google apps. It also covers all menus and settings for the app. Unfortunately, the dark mode for photos only applies to Android 10. At the moment it doesn't work reliably on Android Pie, there's no special setup, and there's no sign of a change on iOS either. Google Sounds Dark Mode As Google continues to implement dark mode in its system apps, the lesser known Google Sounds app has updated with a new theme. For those who don't know, this app is designed exclusively for pixel owners and gives the ringtone interface a handy makeover. Dark Mode Update arrives with the 2.1 version of the app and respects Android 10's wide dark mode system. Remarkably, it has a true-black theme. Google Keep Dark Mode Google's favorite app for many users, especially on Android, is Google Keep. A simple note-taking app has a dark mode that doesn't work the system as a whole, but rather Enable Dark Theme switches in the app settings. The feature arrived in May as part of an update on the server side on top of version 5.19.19. The dark mode of Google Keep uses not a black theme, but several shades of dark gray. The dark mode for Google Keep is also starting to roll out into the web version of the app. Google Drive Dark Mode While many of Google's Android apps are getting a dark mode that works on all versions of the OS, Google Drive is not one of them. One of the latest app updates has officially added dark mode support after months of feature testing, but this seems to only work reliably on Android 10. In this update, users should see the Drive switch between the themes of the dark and light themes based on the broader settings of the system. Some users report that the theme works on Android Pie with dark mode settings enabled, but the results vary from user to user. So far this new dark mode only seems to be available on Android, but Google Drive iOS and desktop customers are likely to get the same After all. Google Calendar Dark Mode If You Wanted to Track Your Agenda Without Burning Your Eyes On On Google Calendar finally has an official dark mode. This new mode is available as an app setting on Android Nougag and new. Just a headline tweaking the total theme will show the necessary switch. On Android 10, Google's dark Calendar mode respects larger system settings. In typical Google fashion, the app uses a pair of shades of gray to work out the theme without losing aspects of the design. Remarkably, the colors at your events remain pretty much the same. Google Chrome Dark Mode For months, we've seen Google start rolling out dark mode for Google Chrome in several areas. First of all, this includes both desktop applications. Both macOS and Windows 10 have easily accessible dark mode that is already available or is about to hit prime time. If you're on macOS, the running version of 73 or older chrome should turn on the dark mode in your Google browser. To turn it on, simply change the system to switch between dark or light modes. Windows, on the other hand, is still in the process of being implemented. Google Chrome's 74 version allows for dark mode on Windows as well as allowing you to match the theme of the system, but it's still a bit fussy at times. As we know, Google is slowly working on a dark mode for all major Android apps, and this of course includes Chrome. Now this functionality is starting to become available. Although it's still not available in the stable version, a recent Canary update showed some flags to switch the theme. After the flag is turned on in the Google Chrome Basics section, the Settings menu displays a dark switch mode. The latest versions of Google Chrome for Android also support a dark theme in the app's user interface elements as well as supported websites. Google Calculator Dark Mode In version 7.6 of the Google Calculator app for Android, the company has added the official dark switch mode. The new switch is just three points of overflow menu in the top right corner of the app. Clicking Select Theme brings up a small menu for manual switching between light or dark topics, and with it automatically set based on the battery saver. Unfortunately, this regime does not respect the systemic option from what we can say. Google Help Center Dark Mode (web) In recent weeks, Google has expanded its support for the dark mode of its online help center. The company's extensive library of tutorial and troubleshooting pages on the Internet is now all supported by the official dark mode. This mode uses not a real black, but a dark shade of gray, which has white text and blue hyperlinks. There are two ways to incorporate this dark mode into a Google help center. On the one hand, you can change /?dark1 to any page you're on. However, the much easier method is to scroll down at the bottom of the page and press the switch on the right side side The setting should stay in place even after you have completely left the page. Google Discover Feed Dark Mode After watching tests lasting for months, Google has finally added the correct dark theme to the Discover channel. Found on the left-most home screen on a large number of Android smartphones including Google Pixel, the new dark discover channel mode is one of those we have been waiting for. Respecting the system night mode, the Discover theme is not a manual option. It will change with your wallpaper or based on the display settings. In previous versions, the dark theme left users with a white background for text, so it's nice to see the right design finally available to everyone. If this option doesn't hit your device, try installing the Google app and reinstalling/updating it to make it change. Google Play Games Dark Mode Mostly Forgotten Google Play Games app also took dark mode in its latest update. This one doesn't reflect night mode, but it's a trigger based on manual customization Once you've installed the latest update, access to the overflow menu. From there, go to the dark theme settings and turn on the settings. It should change immediately from now on and, as usual, it applies to the entire application. Google Phone Dark Mode In the latest update to the Google Phone app, Dark Mode has finally been turned on. Google has been teasing this arrival for quite some time now and it's finally here. The dark mode in the Google Phone app gets into all parts of the interface, including a set, contacts, call history list, and menu. All colors match other themes of Google Material Dark, and it's notable that Google Phone and Google Contacts react to each other in dark settings mode. If one is on, the other is turned on, and vice versa. The manual switch for the dark mode in the Google Phone app is in the settings of the dark theme display. Google Contacts Dark Mode With version 3.2 contacts Google, the official dark mode has been added to the app. This affects the entire interface from the contact list to the details of the contact itself. To turn on the dark mode on Google contacts, you need to have the latest version. Once the update, Turn Dark Theme on should appear on the side menu. In addition, the inclusion of Night Mode within the developer options automatically includes a dark Contacts theme, presumably with other applications that end up doing the same. Google's Gboard Dark Mode Gboard is arguably one of the best keyboard apps available for Android, and adding themes has played a huge part in that. With themes, you can also turn on the dark mode. Of course, the inclusion of dark mode in Gboard is not as formal as some of the other apps on this list. The less, the end result is the same, if not a little better. By Po Po In the Gboard settings, you can visit the theme section to choose from more than a dozen color themes. This includes 5 options that meet the dark theme criteria, some even including true-black themes that are perfect for OLED displays. Google News Dark Mode One of the most common cases is to use a dark topic when consuming content in the evening. This puts much less strain on the eye in a dark environment, which is why Google News has been the main target for the dark theme. In a recent update, Google added a dark theme to Google News. It hits the entire interface once turned on and even has some customization. In the settings, you can turn on the dark mode at any time, automatically at night, or when you turn on the battery economy mode. This reinforces the company's findings that Dark has made better battery life. It also respects the theme of the system, starting with Android 10. Google Maps Dark Mode (Navigation) Another place where you'll find the dark google mode is on Google Maps. This is not a dark mode in the width of the application, but appears solely on the method of navigation of the application. First of all, you'll still have to deal with the white theme in the app, but you can switch night mode and leave it for all time. It's especially convenient at night, but it looks great any day. You'll be able to get out of dark mode at 24/7 in both Android and iOS versions of the app. We have a handy tutorial below on how to do it. How to force dark mode on Google Maps navigation for Android Google teased the real dark mode for the Android app, but it hasn't arrived yet. Gmail Dark Mode (web) For many years, Gmail has supported custom themes, and thanks to this, its web version pretty much always supports a dark theme. Unfortunately, this is also one of the most limited options on this list. When applying a dark Gmail theme on the Internet, only the overall interface is covered. Once you open the email or click on the menu, you'll still see the white elements of the interface. One can hope that Google will update the experience to improve this, but for now, this is what it is. To do this, you need to press the settings button in the Gmail web interface and press the Topics button. Under the photo collection, you'll see a default white theme, with a dark version next to it. Just click on this option and click Save. Google Authenticator Dark Mode If you use 2-step authentication and you really should, Google Authenticator is a convenient way to track the necessary codes. In a recent update, Google added a dark mode to this app. With a quick switch to the overflow menu, you can turn on Google's dark mode for Authenticator. Like the others on this list, it's not a true-black theme, but it looks great and The whole interface, except for a few menus. Snapseed Dark Mode Google popular photo editing photos Snapseed, this is another place where there is a dark switch theme, proving particularly handy when trying to focus on editing photos. It gives out the same look as Adobe Photoshop. To incorporate a dark theme into Snapseed, you'll want to head into the app's settings, and the first option gives you a simple dark switch theme. Flip this over and you'll be presented right away with a dark version of the interface that uses the same non-black as Google's other dark themes. YouTube TV Dark Mode (web) While the standard YouTube app offers a dark mode across all platforms, YouTube TV offers it exclusively on the Internet. This theme, like YouTube, is a service-wide. It covers the entire interface, including all menus. Personally, this is one of my favorite looking dark themes as it suits the YouTube TV interface very well. It is currently unclear if YouTube TV will distribute this theme to their Android and iOS apps, but we can certainly hope that it will arrive sometime soon. To turn on the dark YouTube TV mode, click on the settings profile of the zgt,, the dark theme of the toggle on. What are the following Google Dark Mode apps? Obviously, Google is not slowing down with the addition of dark themes for its various applications, and this is a huge win for everyone. What's next? Well, we have a few apps to follow. Stay tuned!
