If your device is in the compatibility list above, the short answer is : yes but it depends on your firmware version, the latest firmware has less chance of being rooted. If your device is not in the compatibility list and it embeds one of the processor mentioned above, the answer is : try it and see. Why does framaroot not root anymore after I have updated my device ? Because framaroot utilize security holes found in multiple devices that have patched up with the update you've done, so exploits can't root the device anymore. Framaroot's exploits have a very short life span to keep your device less vulnerable to other malware. Keep in mind that framaroot is not a permanent rooting program. I loose root after update, what I can do to root my device now ? One piece of advice : if you want a chance to keep root after updating, do not update with Kies or ODIN for samsung or not flash system partition, prefer OTA update and use ota survival feature in Superuser or SuperSU. And if have no choice, can you use the traditional method : flash tools specific to your device Will framaroot include more exploits? Yes, but don't ask when because I don't know myself, it depends on the vendors fix answers. Framaroot crash when I choose Gandalf exploit ? Often the first time you start Framaroot by selecting Gandalf as the exploit, it crashes Framaroot. Do not worry, in this case you need to re-start Framaroot and select Gandalf again, the second time it will work. What does error# mean on results ? Any error less or equal to 9 means your device is not vulnerable. If you get the wrong #10, give a try with Framaroot 1.5.3. Any other error needs some investigation about your kernel image. Framaroot say Success but SuperSU is not installed after reboot ? Maybe there is some additional protection on your device or something goes wrong with the SuperSU version embedded in Framaroot. In this case, I recommend using perform script action and put your own shell script commands in /sdcard/custom (use at your own risk, all commands are executed with root privileges). Look at this post to know how to use custom scripts. What can I do when the result is Half-success? You'll see this message when the /system partition on your device is a read-only file system (such as : SquashFS). To deal with this case Framaroot try to use a trick by adding ro.kernel.qemu =1 to the file /data/local.prop. To test if this trick work, you need to restart your device and connect to it with adb shell. Once connected type id command to see if you are root. If you are not root, your last chance is to select perform script action and put your own shell script commands in /sdcard / custom (use at your own risk, all commands are executed with root privileges). Look at this post to know how to use custom scripts.
