Many people find what they need to the garage through opener program on a HomeLink system that came with their car. Maybe you bought the car used and don't have a tutorial, or you have a tutorial, but find it hard to follow. In both cases, it is not difficult to program the garage door opener. It should not require more than 5-10 minutes, as long as you follow each step carefully. To have a helper, the process will let go even faster. The recipient, portable transmitter and in-car transmitter should all be in good operating condition to ensure success when you program the garage through opener program. The HomeLink system is available on a wide range of cars, and it can also be purchased as a aftermarket product. It is compatible with almost all garage through opening systems including Liftmaster, Chamberlain, Craftsman, Genie, Overhead Door, Allstar, and Wayne Dalton. The primary requirement is that the garage door opener works at a frequency of 288-433 MHz. You should be able to find the frequency of your unit on the back of hand sender. To program the garage door opener, it will be necessary to collect and lower the door. So, to keep the process safe, make sure that children and pets stay away from the garage. Once you're ready to get started, follow these steps: Always start with a new battery in the sender. If you're not sure how old the battery is, go ahead and replace it. Rotate the key to the accessory (ACC) position before you start programming the garage door opener. For the first time programming (or if you think the garage door opener is previously programmed), press the two outer buttons on the sender for about 20 seconds until the light starts to flash. Stop the button to be programmed until it starts to flash slowly (20-30 seconds). Hold down the button for the next step. Grab the hand sender in your other hand and point it to the flashing light of about two inches away. Press the operating button on the hand unit. Once the light starts to flash faster, the frequency entered into the HomeLink transmitter. Leave both buttons. This step is easiest with a helper. You will need a ladder and, quite possibly, a flashlight. On the garage door opener recipient (ie, the car, located inside the garage), press the training button (also known as a smart or leather button). The button may not be marked, but it will have a small light next to it that flashes when pressing the button. (Note, if the indicator remains light continuously, the programming is complete, and the garage door opener must function.) If the indicator flashes light (or if it briefly flashes before you are constantly illuminated), you have 30 seconds to run the next step (which is why it go with a helper). In the car, with the key still being turned to ACC, press the button you've programmed on the in-car sender for three seconds. Remove your finger from the button and then press again for another three seconds. If the garage door hasn't moved yet, press the button for another three seconds. Once the door moves, the garage door opener is programmed. If your garage's door opener doesn't seem to respond to programming efforts, then plug the recipient for a minute, then try again. Make sure your new battery in the hand-bearing sender is correctly installed. If you still can't properly program the garage door opener, call the HomeLink Customer Service section (1-800-355-3515). If problems persist, you may need to buy a new garage door open. opener.
