Faulty locks (click here) It is very rare that a TSA lock becomes faulty when used normally. If you are experiencing problems with the TSA lockdown, it will usually be due to some form of impact damage (possibly caused by mishandling of airline employees, see details of transit damage on our warranty page), or due to the installation of the lock incorrectly. If you forget the combination code, or it was installed incorrectly, unfortunately for security reasons, there is no easy way to reset it. You will either visit the repair center and they will replace the lock at your expense, or you can cycle through, and check, all combinations (from 0-0-0 to 9-9-9), which takes about 1 hour. Imagine the scene you have just arrived at a hotel in an unfamiliar city after a long flight. You put your suitcase on the bed and slowly turn the numbered wheels of the three-digit combined lock. You press the button to access your case, but nothing happens. Metal lightning tags remain firmly trapped in the lock clasp... A locked suitcase with a TSA-approved lockgetting combination locked out of your luggage is something that happens even to the most experienced travelers at one time or then. Fortunately, the ubiquitous, TSA-approved, 3-digit combination of locks used by brands such as Samsonite, Eastpack, Antler and American Tourister is easy to open without damaging either the lock or the case and without any special tools. By following the steps below, you can quickly open the lock and reprogram the code to a new 3-digit combination that is easier to remember. A three-digit TSA007 combination suitcase lockAs unlock your suitcase when you forget the combinationif you look close at the lock from above, you will see that to one side of the three umopt thumb-wheels there is a small disk (see photo below). I found that the best way to see the drives is using a cell phone camera. Choose a video camera and shine flashes down into the lock then zoom in to see the drives more clearly. Starting with the first thumb of the lock wheel, turn the wheel with one click at a time until you see a notch on the disk, as shown in the photos. Once you are lined up then repeat the process for the second and third digits until the notch of all three wheels is lined up (see photo blue suitcase). Once all three cutouts are lined up, turn on the suitcase so you can see the rooms. Note that this is NOT a combination code. The ncto-image is not visible on any disk. On the next line, add 1 to each digit. Repeat this 9 more times until you have a list of 10 3-digit numbers, as shown in the photo below. Try the codes one at a time until you find the one opens the suitcase. Once the case is open you can change the combination for one that easier to remember. With practice, the whole procedure takes less than 2 minutes. Video: How to quickly open your suitcase lock when you forgot CodeWhen writing this article I used 2 different suitcases, both of which are equipped with TSA-approved Travel Sentry combination locks. The locks are slightly different models, but the procedure is identical. I made the video using an old, blue, suitcase because the cutouts in the green plastic discs are easier to see than the cutouts in the black discs of the red suitcase. The code that opened the red suitcase was 2 clicks from the position of the lined disks. The code that opened the blue case was in 8 clicks. If none of the codes that you wrote work for you should check that you lined the cutouts correctly. As you can see in the video, there are usually two positions where the notings are visible. Make sure all 3 cutouts are lined up in one position. You can see that in the video I lined up the drives in the right position. The noting on the left disk is now visible How do the combined locks work? The three-digit combined locks used on suitcases are designed so that you can change the combination to a unique code that only you know. To do this, you must first set the lock of the current combination. Then press a small button (usually using a ballpoint pen) that frees the moderate large wheels from the locking mechanism (currently in an open position). You can then turn 3 measured thumb wheels yourself into a new combination before you press a large button (the one used to open the lock). This reconnects the moderate flash wheels to the lock mechanism, activating the new code. The method described above is based on the fact that part of the locking mechanism itself (jagged discs next to the big wheels) is visible. This makes the number shown on the knurled thumb wheel pretty much irrelevant. After aligning the discs you just need to turn them around until the lock opens. Cutouts on all three discs lined upWhat TSA Approved Locks? The TSA (Transportation Security Administration) is a U.S. federal government agency responsible for the safety of travelers, which was created in response to the 9/11 attacks. All luggage is scanned before being loaded into planes, and if any prohibited items are found, it will be opened by airport staff and items seized. TSA-approved locks identified by the Travel Sentry logo in the shape of a red diamond can be opened with the basic keys. Locks are often included in suitcases, but TSA-approved locks are also available. If your suitcase can't be opened with a master key, then if they need to inspect your luggage, airport staff will open it by force, cutting off locks etc. Available only for employees, but in fact anyone with a 3D printer can print out their own master keys. Is it really worth blocking my TSA-approved baggage lock? As we have seen, the 3-digit combined locks installed on most modern suitcases provide very little or no security. At best, they stop your suitcase from opening accidentally during transit, preventing your dirty laundry from spilling on the baggage carousel. Some suitcases (including the red suitcase in the photos) have small metal hoops included in the zip-pullers allowing you to use the lock to lock the suitcase. While at first glance it may seem to add a second level of security, in fact, it's a waste of time. As shown in this video, zipper closing suitcases can be opened quickly and easily using a ballpoint pen. Once the lock opens, you can change it to one that you can remember the three-digit combined locks on the american Tourister luggage pieces set at 0-0-0 at the Samsonite factory. Each bag comes with instructions on how to set a personalized combination. If you remember the combo, just roll up the three dials until your combination shows from left to right. Listen to the click of the lock of the disconnects, and unpack the bag. If you forget the numbers or want to reset the combination, you will have to work a little harder. If the combination is not available, chances are you didn't install a new one when you first received the bag. Roll the dials at 0-0-0 to see if that's the case. If the bag opens, you can save this simple factory code set or you can reset the new personalized combination. If the plant combo doesn't work, it's likely you'll install a combo at one time, but forget - so a bit of brainstorming. Your combo probably reflects something personal to you, such as an address, birthday or phone number. Roll the dials by trying any three-digit number that can mean something to you by listening to the click of the locking of the disconnects. After trying to crack personalized code, you have two options, and both are equally inconvenient. You can try every combination in the book, starting with 0-0-1 and going to 0-0-2, 0-0-3 and up. Your combo lock has 10 possible numbers to choose from on each dial - from 0 to 9 - making for 1,000 possible combinations. But some blocked owners have found success with this tedious method. Another option is to call the 24-hour American Tourister customer service hotline at 1-800-765-BAGS (2247). A representative can tell you where to find an authorized repair center that can help open the bag for you. Of course, you will have to prove ownership by producing a receipt or warranty from the Purchase. Once you've cracked the code, you can reset the combo anytime you want: Unlock the bag. Roll the dials so that your combo shows from left to right to disable the lock. Find a reset button or lever next to the dials. The button can be small and drowned, drowned, tip the pencil to press it, and the button or lever may be inside the bag. Press the button until you hear the click, or move the lever to a position down from the dials. Hold the button or lever in this position. Roll the dials until your new, personalized combo shows from left to right. Release the button or return the lever to its original position. Your new combo is now installed. You can write the combo down and keep it in your wallet, in your desk or with your passport, but the paper can get lost. Instead, write a letter to yourself and give it the right American tourist Combo. Next time you dust off your luggage, get your smartphone and use the search feature of your email for your combination. It'll always be at your fingertips. Turn the three wheels on the lock to the current combination and open the luggage. Dial three wheels to 0-0-0, which is the default combination option for American tourist and Samsonite luggage. Press and hold the reset button on the side of the lock inside the luggage. Turn three wheels one at a time onto a new three-digit combination and release the reset button. He wrote about electronics, home appliance repair and outdoor themes for various publications and websites. He has more than four years of experience in the field of household appliances and electrical repair. Clark holds a Bachelor of Political Science degree. Page 2 Turn the number dials on an previously set combination, or at 0-0-0, the default factory combination for Samsonite luggage. Find a reset button that is usually located away from the combination set. Press the reset button and hold it by rotating the number to dial the desired combination. Set this in sequence easy for you to remember, but hard for others to figure out. Release the reset button after the numbers are set up in a new combination. Check the combination by turning the dials into a new code to open the lock. If the combination doesn't open the lock, repeat the steps from 1 to 4 and check the lock again. If you still can't open the lock, contact Samsonite Customer Service at 800-765-2247. Leaf Group is a U.S. TODAY partner providing general travel information. She has written several articles on health care and promotional publications for websites such as KennethCole.com and Panasonic.com. The church studied at Delgado College with a degree in surgical technology. Page 3 is the idea of someone sucking through your personal belongings, viewing them and considering without care, confusing. Baggage check-in Airline staff or security can put a pit in the stomach. Fortunately, Master Lock has created TSA-approved luggage locks that prevent strangers from getting out of your bags, allowing security to open them for inspection with special tools. Earlier, the Transportation Security Administration simply cut off the locks. These three-digit combos should be personalized, so you choose a combo. But don't worry. There is a way to open the lock even if you forget the combo. The easiest way to unlock a three-digit lock is to use the combination and follow Master Lock instructions. To do this, turn the lock until the numbers are read from the right side up. Roll the left of the dial until the first number of your combination lines up with a hammered hash sign just to the left of the dial. Roll the middle dial to the corresponding line number with the number to the left of it. Do the same for the right number. Your three-digit combination should now show, from left to right, lined up with scoring hash marks. Pull the lock case away from the U-shaped metal ring without turning any of the dials. The lock will press open to expose the hook. The hook rotates 360 degrees so that it can be placed on, and taken off, luggage. If you forget the lock combination, try this alternative method to unlock it: pull the lock's body and U-shaped ring apart to put pressure on the mechanism inside the lock. Pull the body of the lock from its attachment, or, if the lock is not attached, apply pressure on the U-shaped ring from the body of the lock with your fingers. Keep a solid, steady pressure. Roll the dial closest to the U-shaped ring slowly, while maintaining constant pressure on the mechanism. The dial will be difficult to flip three consecutive numbers, and one of these numbers will click. You have to feel and hear this little click and this is the first number of your combination. Repeat the previous step with the middle dial and then the farthest dial. Leave the dial set when you find the click, moving to the next dial. The combination will appear, allowing you to pull the U-ring from the body of the lock. Reset Master Lock, install your own combination, and you can use it properly in the future according to the original instructions. Here's how: Hold the body of the lock so that the numbers face off you. Set the combination and release the U-shaped ring. Turn the U-shaped ring hook 90 degrees counterclockwise before noting on the stem of the hook and a hole on the lock body line. Push the stem of the hook down into the body of the lock as far as it will go. Turn the hook another 90 degrees counterclockwise while it is depressed in the body of the castle. Roll the dials until you have a new combination. Turn the hook 90 degrees and lift the stalk out of the castle's body. Turn it another 90 degrees clockwise and push it back into a blocked position. The lock now uses your new combination. Tip Email yourself password to lock, and email name Baggage Lock. If you forget your password in the future, just look for email for the term baggage lock. Tip Don't open a castle that doesn't belong to you. It's against the law. Leaf Group is a U.S. TODAY partner providing general travel information. Its content is made independently of the USA TODAY. Christopher Michael began writing about the author in 2010 for Break.com. He received a Bachelor of Arts degree in English from the University of Massachusetts, Amherst. Writing sports and travel articles helps support his professional baseball career, which has taken him to 49 states, five continents and four oceans. Page 4 Travelers flying to the United States have only a few options when placing the lock on their bags: they must choose TSA-approved luggage locks or risk that their locks will be destroyed. Transportation Security Administration (TSA) agents have a universal master key for opening agency-approved locks, so they can open and inspect a passenger's luggage without causing any damage. If a passenger decides to travel with a different type of lock, however, the TSA may have to destroy the lock to check the luggage. Tumi luggage comes with TSA-approved locking systems, either with a lock built in the case or attached to the outside. If you're using Tumi luggage, it's important to learn how to properly lock - the TSA may have the right to search for your luggage, but you don't want anyone else to get there. Suitcases from Tumi's Vapor and Tegra lines have an internal lock system built into the hard shell case. To install these locks, follow these instructions: Set the lock dial on the current code. If it is a new luggage space, a pre-set code is usually 000. Safe lightning pulls into its place on the lock mechanism. Look for a small circular divot in the lower left corner of the castle. Use the ballpoint pen to put pressure on the divot, and keep it as you adjust each number on the dial to create a new three-digit code. Once you've created a new three-digit code, let the pressure on the divot go. Find the large release button to the right of your luggage's Tumi logo. Click on it, and if the zippers pop out of their zipper to pull the place, your lock has been set correctly. Other toomey baggage lines come with an external locking system, not a system built into the shell case. To set up the lock correctly, follow a slightly different series of instructions: Turn the lock so that the Tumi logo is facing you, and rotate the dials until they disable the current code. If you're using a new lock, a pre-installed code code be 000. Find a small divot on the lower edge of your lock and put pressure on it with a ballpoint handle. Continue to put pressure on the divot when the dials are twisted to create a new three-digit code. When you create a new code, let go of the pressure from the divot. Find the big release button to the right of the Tumi logo and click on it. If the lock clip opens, you've correctly installed a new lock code.
