Not finding your answer? Contact Lexus

The volume level for navigation guidance on map apps within Android Auto (Waze, Google Maps, etc...), will remain at a constant and separate level from any simultaneous audio playback through Android Auto or the Lexus Multimedia System. You can adjust the level of navigation orientation volume by navigating the → installation program to → on the vehicle's media system.

1. 2. 3. Volume Control is an amazing application that allows you to take control of the volume of the device – instead of being controlled by it! HOW IT WORKED

Volum control is extremely easy to use. Simply adjust existing predefined volume profiles or create new ones and alter them with one tap. Individual profiles are made up of: Alarm, Media, Bell, Notification, Voice (in-call), Bluetooth and global system volume.

AUTOMATED VOLUME CONTROL also detects when you insert headphones or activate Bluetooth, and automatically closes to your preferred volume profile. You can even create automatic scheduled presets based on time of day, physical location, or calendar event. For example, if you plan to enter a business meeting, just tell the app to turn off the bell right now. If you're going to a workout, tell the app to pump the volume when you get to the gym. The list of possibilities is practically illegal!

ADDITIONAL SPECIAL FEATURES

A few of the other special features you might expect:

- Custom volume settings and ringtones for VIP contacts-
- The option to separate or link the ringer volume and volume of notifications -
- The ability to change ringtones for alarm, ringer and notifications-
- Notification shortcuts for quick and easy access to controls and predefined -
- Integration with Tasker and Locale through the built-in built-in WIDGET PLUGIN

You can also access a fantastic suite of fully interactive home screen widgets, including:-

- Predefined (apply a set of audio configurations):-
- Predefined list (apply any predefined)-
- Volume closet (change/lock volume levels)-
- Vibrate (toggle vibration settings for bell and notification)-
- Bell (toggle bell mode between silent , vibrate, and normal) -
- Dashboard (various interactive volume controls)

Note : to access widgets, the application should not be installed on the SD card.

AVOID ACCIDENTAL CHANGES

You will also love the cool Pocket Locker function, which automatically prevents accidental volume changes by blocking volume settings when the the device is turned off.

MULTIPLE LANGUAGE SUPPORT

Arabic, Czech, Danish, German, Spanish, Finnish, French, Hindi, Hungarian, Italian, Hebrew, Japanese, Korean, Malay, Norwegian, Dutch, Polish, Portuguese, Russian, Slovak, Swedish, Thai, Turkish, Ukrainian, Vietnamese, Simplified Chinese, and Chinese.

PERMISSIONS

Sein note that the following permissions are required to use the app (the feature/reasons are provided in brackets):-

- Complete network access/network view connections (bug reports, Google maps, usage).
- Reading calendar (predefined schedules based on calendar events)-
- Modify system settings (change advanced volume settings)-
- Thick and thin location (detect location changes for scheduled presets-
- Vibration control (notifications)-
- Read /Write External storage (access custom icons and ringtones)-
- Run on startup (restore settings after startup)-
- Read your phone's status (required to separate the bell and volume of notifications in all versions of Android)-
- Performance improvements.

Google Maps is probably the best map out there, which comes with so many features and options. You can easily find unknown places on Android Google Maps. This usually comes with the stock of Android OS and you don't have to install the app on your Android device as it is a 99% integrated Android mobile app. Today, most people use various maps such as Google Maps, Here Maps etc. instead of notebook and pen or physical maps to navigate through and find an unknown place. Some people often travel solo with the help of Google Maps.

However, if you're using Google Maps for a long time, you may know that there's an option called Google Maps Navigation. If you turn on navigation on Google Maps, a voice will dictate to you through your location or road from your current location to your destination. This is called Google Maps navigation, which helps the bike or car driver to go to a certain place, which he/she does not know. At some point, we need a stronger voice and at some point we need it lower. At this time, if you use the Android volume increase/ down buttons to adjust the volume, you can do so. But, the problem is all volumes including media player (in case a music is playing), system and navigation etc will be adjusted together. Obviously, this is not a good thing at all because we can't open the settings every time we need to adjust the volume. However, here is a tutorial that will help you adjust only Google Maps browsing volume without any problems. However, you will have to put it for a particular navigation. For each path, you can set a different volume level. However, you cannot set the volume by levels as you can do for the volume of the Android system or the volume of the media player, however, this is possible / decrease the volume level. Adjust only the browsing volume of Google Maps on Android

Google Maps has the option that allows you to set the volume only for Google Maps navigation. The system volume or media player volume will remain the same. To do this, you do not need to install any third-party software. Google Maps has the built-in option. Just follow these

First, open Google Maps and tap the Settings menu defined by three horizontal lines that is placed in the top left corner of the screen. Then scroll down and tap Settings to open all options and set things up according to your desire. Here you can find navigation settings. Open this to get navigation-related settings. Now, you can get the voice level, which must be set to Normal. You can select stronger or softer. Both options do what they define. That's it!

We hope this small configuration will help you a lot.

How to change your Google Maps navigation voice

If you live in the US or UK, English is the primary language of your mobile. However, suppose someone lives in a country where English is the default language of mobile, but he or she cannot correctly understand this language. There are countless people, who do not understand this language and who drive to live. If someone like that wants to change the voice of Google Maps navigation, here's what you can do. There is no need to use any third-party software or root your mobile as Google Maps has this option to change your browsing voice. You can set your preferred voice and language using built-in methods. At first, open Google Maps on your mobile; and tap the menu and settings accordingly. Here you can find the navigation settings. Click this option to open navigation-related settings. On the Navigation Settings page, you can find an option called Voice Selection. Tap this option. After that, you must select a language that you know and understand. After that, this language and voice will be used for Google Maps navigation. You can do the same on both android and iOS.

Make sure you have the latest version of Google Maps.

When I first got the ascent and when I connected to my Android phone to use Google Map navigation there were two volume controls, one for radio volume and one for Google Map navigation. While a song was playing adjusting the volume controlled the radio volume and while Google navigation gave step-by-step directions the volume control would control the volume of navigation. In addition, when it worked as noted above, the front speakers would carry the navigation audio while the rear speakers continued to retain the radio. Now, when navigation directions are given, navigation comes out of only the front speakers and the radio stops playing through the rear speakers. It makes sense and I probably prefer the new method. At some point something changed, I guess on Android Auto, because now the indications use the same volume control. If the navigation directions are too low, turn on the volume DURING the TBT directions spoken in order to better listen to the instructions. When the spoken directions complete the radio volume explosions in the new volume. Any warning of anything and if you were able to control the two audio sources separately?

· What version of the firmware is your radio in?

· i don't use Android but in Apple CarPlay , if you play radio from the APP or Pandora or songs from your phone its all considered an audio source same as Navigation (phone navigation) but if your car present Radio is a separate audio source vs phone navigation

Also Google Map turns off (full silence) another audio source during directions, but Waze only dims it

· If it's configured just like CarPlay, yes, navigation from your device's audio is controlled separately from the radio volume. You can change it while the app speaks or is in your settings. I actually had to do this yesterday as apparently my daughter while trying out my new Ascent, accidentally lowered the volume associated with this type of app to zero.... I would hear the lowest volume in the melodies, but not hear any direction spoken. So since I was moving, I waited for the next set of directions to begin and as soon as the volume of music fell, signaling coming in from Google Maps, I increased the volume with the control of the steering wheel and then I could hear Miss Google as before.

I'll check the firmware version.

The distributor says there is no update for my non-navigation model. Do you know otherwise? Otherwise?
