Evod e cig user manual

Before you start using a brand new atomizer, you must first prime it, which means getting the wick material nice and saturated before applying heat. If you do not prime your atomizer before going to use it, all the dry wick material inside the atomizer will burn and the coil will be damaged, possibly requiring a new one. There are a few different ways to prime your atomizer, one way to do this is before filling your tank, drip 3-5 drops of liquid e directly into the top of the atomizer and while this soaks, you can also add a drop on each piece of wick that you see stinging on the side of the atomizer. This method ensures that the atomizer is completely saturated before use, but if you are in a hurry or have no e liquid with you in addition to what is in your tank, there is another premium way. For the other priming method, all you do is replace the old atomizer with the new one, reassemble your tank, then without applying any power to the Kangertech EVOD battery, take at least 5 strong pulls on the mouth piece. This will help pull some of the e-liquid into your tank down into the atomizer, saturating the wick. It is possible to get too much e-liquid into the atomizer initially and it could end up flooding the atomizer, which can cause e liquid to spit through the mouth piece or leak through the bottom of the tank - but again if you don't put enough, the atomizer could be burned right away. It's a kind of liquid amount balancing game that you need to use to prime your atomizer, but after a few go at it, you should be able to do it in the blink of an eye without any problems. Flooding and leakage problems Above the priming and certain environmental elements can cause your atomizer to flood or leak from your tank. Changes in altitude, extreme heat or cold and excessive tightening/sub are all cases that can cause these problems. Although a small amount of leaks are completely normal and to be expected, sometimes you experience major leaks. If this happens, disassemble your vape pen and wipe all the liquid out of it; Make sure you get the top of the battery where the tank connects, if too much liquid e gets in there or it stays too long, the EVOD battery may be damaged perhaps beyond use. Before going back try to think about what caused this to happen in the first place, ask yourself questions as was your tank more /under tight, travel in a major change of altitude, was it left in a too hot, ETC. With the power of deduction, you should be able to understand why it happened and from there you can reassemble your vape pen and hopefully prevent it from reproducing right away. If your atomizer is flooded, whether it's coinciding with leakage problems or just more priming your coil, there are a few things you can do to help it dry out a bit. One trick is to flip your vape vape pen down so that the juice does not flow down into the atomizer. Once you have your device upside down, hold the button to pull your Kangertech EVOD battery and blow into the airflow holes, this will help pull any excess fluid out of the mouth. Another way you can get the atomizer to dry a little more is to disassemble your vape pen all the way, then wrap your atomizer in a cloth and give it a good shake. Flooding and leakage can be a pain to treat especially when you're so used to lighting a cigarette and that's it, but hang on in there cause once you get a handle on these issues, you can continue your effort to stop smoking cigarettes successfully. Cleaning your Kangertech EVOD At Slim Vape Pen, we recommend the EVOD starter kit for vape pen users of all levels of experience, from beginner to long-term user. This is a fantastic, basic vape pen that works great when you need it and has no fuss about it. The experience of using a vape pen is different with each brand and model, so we often have customers ask us what their experience is going to be like with the EVOD. Using the EVOD Vape pen is easy, fast with virtually no learning curve, so be prepared to be amazed when using the EVOD starter kit. This is more or less a global EVOD Starter Kit tutorial and instructions on exactly how to use your new EVOD starter kit, so take a look below and enjoy all the ins and outs of this amazing starter kit. Evod Starter Kit Here are the basics you can expect when you buy Slim Vape Pen's EVOD starter kit: Unboxing the EVOD Starter Kit Your EVOD Starter Kit will come in the mail in a cushioned bubble wrap envelope. We make sure that your EVOD starter kit is fully protected from mail damage, and at the same time we also try to keep shipping costs as low as possible so that we can keep our prices low and pass those savings on to you. When you open the package, you will find the EVOD Starter Kit box inside, with a bottle of juice. The EVOD box has your 2 evod vape pens inside, fully assembled so you can see how it goes together. When you take out your vape pen, you will also see an extra coating in the box. If you remove this coating, you will see an instruction booklet on how to use and take care of your EVOD vape pen. The bottle of juice has, of course, e juice inside; when you you will also notice that it has a drop of bulb syringe for easy filling of your EVOD vape pen. Recharging your EVOD Vape pen The first thing you need to do is recharge your EVOD vape pen. Simply unscrew the part of the battery (the part with the button on) of the wide metal ring that attaches it to the clearomizer tank. You should see a round area where the battery connects to the charger, with thread to screw the charger on. Attach your charger to your battery and plug in charger in a USB port or attach it to your wall adapter and plug it into the wall. You'll see the button on the battery flash to indicate it's charging, and you'll also see the light on the red flash battery to indicate that the battery is not charged. The light will either show a solid red light or flash between red and green as it charges. When your EVOD battery is fully charged, the light will appear solid green. At this point, you can remove the charger's battery and attach it to the rest of your vape pen. Fill your BCC tank on the next EVOD starter kit, you will fill your EVOD BCC clearomizer tank with Nicoclean e juice. To do this, you unscrew the clearomizer tank (the top with clear slits where you can see the level of juice e) of the wide metal ring attached to the battery. When you detach these two portions, you will see the atomizer part of the clearomizer. It is a metal pole and a short wick on the thick metal ring. Set the battery and atomizer coil to one side and turn the clearomizer tank upside down. Use the eyedropper e juice to fill the clearomizer tank from the sides, and be careful not to get e juice in the hollow central part of the atomizer tank. If you get e juice in the middle, clean it thoroughly or you will end up with drops of juice in your mouth with your steam. When your EVOD clearomizer is full, turn the battery and atomizer coil upside down and carefully screw the pieces together. Turn on your EVOD Vape pen Your EVOD arrives in the default off position, so if you press the button, it won't work, even if it's fully charged. To activate your EVOD, press the button five times. The LED light on the button will flash three times, indicating that it has been turned on. You can turn it off again by pressing the button 5 times, which will prevent it from accidentally activating in your pocket or purse. Cleaning your BBC tank on the EVOD starter kit You will need to clean your EVOD regularly, once a week or every time you change electronic juice flavors. Thanks to the lower coil clearomizer model (bcc), cleaning is easy and relatively quick. To do a thorough cleaning, you will want to rinse the atomizer coil with alcohol (vodka or rubbing alcohol) and let it dry for 24 hours. This will get your atomizer coil completely clear of residues and is the best choice to change flavors. You can also do a faster cleaning just by rinsing your atomizer. If your atomizer coil starts to while you're using it, it's because e juice becomes directly on the atomizer coil and flood it. You can clean this easily by unscrewing the atomizer battery, putting a cloth on the lower side of the atomizer, and blowing through the mouthpiece. This will eliminate your atomizer coil and get rid of excess juice. If there is a On the battery connector, you should just wipe it with the fabric to make sure you don't lose tension with every puff. All working parts on the EVOD starter kit The work parts on the EVOD are the battery and the atomizer coil. The battery will last you for a while before it starts to lose charge. The coil of the atomizer will probably need to be replaced after a few weeks, because the heating element itself will eventually wear out. You'll know it's time to replace your coil when the steam starts to taste burnt and/or it stops producing as much steam. However, there are also other troubleshooting things that you can try for these two symptoms before replacing your coil: a burnt taste can be caused by your wick clogging and needing to be cleaned with alcohol (vodka or rubbing alcohol), and the low production of steam may be due to a low battery or e juice on the battery connector keeping your coil from getting full power. Questions about the EVOD Starter Kit If you have questions about using your new EVOD starter kit, most of the answers to your questions can be found below: Twist-T3S User's Guide Since a twist-T3S starter kit is a custom kit that we have created, there is no user guide to the manufacturer for it. Naturally, we created our own. Loading the batteries of your Twist-T3S E-Cigarette Although many people think that a brand new battery evod twist e-cigarette should be fully charged before it is ever used, this is not based on electronic sound theory regarding lithium-ion batteries. Lithium-ion batteries have no memory so there is no reason to follow the charge practices of anes and anes and already with these batteries. The fact is, when you first get an e-cig battery, you won't be the first person to charge it anyway; The plant always puts a full or partial charge into the batteries to test them before boxing them and shipping them. It should be noted, however, that lithium-ion batteries tend to last longer if they are not fully drained each time before being charged. We realize that this is particularly difficult to judge especially with a very large battery like a 1100mAh EVOD Twist battery. Also keep in mind that if the plant has just recharged the battery enough to test it, it will not produce as much steam as a fully charged battery and, of course, it won't last very long before it needs to be recharged. However, we always use them out of the box until they are Then we give them a good long charge the first time to make sure they are fully charged for our next use. Keep in mind, these are super capacity batteries, so they take a long time to charge when they are completely drained. When an EVOD Twist e-cigarette battery completely loses its charge, it flashes a dozen or more times. Any other attempt to use the battery will be futile. When this happens, it is certainly time to your Winder battery as follows: 1. Attach the USB charger cord directly to a computer or USB port powered by any other device. Keep in mind, however, that it will take much longer to charge a Winder battery from the low-power USB port than it does from an AC wall socket. 2. Plug the cord into a work ac socket (obviously, you don't need to if you're going to charge your battery from a computer or other USB device). The light in the room that connects to the wall must turn red, indicating that it is receiving energy. The actual light from the charging cord will be green. 3. Take your battery (the longest component of your Twist-T3S e-cigarette that has a button on it) and screw the threaded side into the charger, turning clockwise. DON'T SCREW YOUR WINDER BATTERY TOO TIGHTLY. Stop when there is resistance and you see the light on the load cord going from green to red. If you screw your battery on the charging cord too tightly, you can force the pole down into the battery where it will no longer be able to come into contact with the charger or a clearomizer. 4. Charge the battery until the light on the charger switches from red to solid green. Sometimes you can see the light on the charger flickering between red and green. This means that your battery is partially charged and can be used, but it is not fully charged. It should take somewhere between 8 and 10 hours to charge a fully drained 1100 mAh EVOD Twist battery. IMPORTANT: The following precautions should be exercised when charging the batteries e cigarette: 1. Only charge the batteries e cigarette with the battery charger that comes with the kit. Using chargers with incorrect voltage or current can cause a fire or permanent failure. 2. Never leave a charging battery unattended. 3. Never charge a battery overnight while you sleep. 4. Never charge a battery longer than necessary. When fully charged, remove the battery. Leaving a battery in charge when it is full can degrade its performance. Although e-cigarette batteries are equipped with circuits that are supposed to prevent overload, electrical components sometimes fail and overload can lead to a fire. cord to the USB port in the AC wall socket. You can skip this step and plug in you're your
