It's one of your endocrine glands, which make hormones. The thyroid helps define your metabolism - how your body gets energy from the foods you eat, millions of people in the United States have thyroid diseases. Most of them are women. If you have a thyroid disease, your body uses energy more slowly or quickly than it should. A thyroid gland that is not active enough, called hypothyroidism, is much more common. It can make you gain weight, feel tired and have difficulty dealing with cold temperatures. If your thyroid is very active, it makes more thyroid hormones than your body needs. This condition is hyperthyroidism. Too much thyroid hormone can make you lose weight, speed up your heart rate and make you very sensitive to heat. There are many causes for both conditions. Treatment involves trying to reset your body's metabolism to a normal rate of 9 CM Volume Index Entries 2 containing references from back to 246.9:Disease, patient - see also Syndromethyroid (gland) NEC 246.9Disorder - see also Diseasethyroid (gland) NEC 246.9specified nec type 246.8Dysfunctionthyroid 246.9complicating pregnancy, childbirth, or puerperium 648.1hyperfunction - see Hyperthyroidismhypofunction - see HypothyroidismDysthythyroidism 246.9 246.9
