Google Calendar added support to the CalDAV standard by opening the synchronization area... More, this doesn't mean you can sync Google Calendar. This means that no matter what you use-outlook at work and iCal at home, for example, you can always stick to desktop calendars if that's what you prefer. Google Calendar now works as a great web application and a special synchronization tool. It's a cloud, and once it's set up, you'll never have to access your calendar online again unless you feel like it. But when you're not on your desktop, you can ignite GCal from any web browser, make changes, and still be sure that your desktop is fully synced the next time you prepare it. Start. Microsoft Outlook synchronization with Google Calendar Events between Outlook and Google Calendar has been a cinch ever since Google came out with Google Calendar Sync, a free app that provides bidirectional synchronization between them. (It also supports one-to-one synchronization in any direction if for some reason you don't want two-part synchronization.) Assuming you use a supported installation (Outlook 2003 or 2007 and either Vista or XP). here's how to make it work. Download and install Google Calendar Sync. Enter your Google account email address and password. Choose a synchronization method (most likely you need two-way synchronization) and your preferred synchronization frequency. It defaults to synchronization every 120 minutes, which seems a bit long for most. Hit Save and you did. Easy, isn't it? If you've added a new item to your calendar and want to force a new synchronization rather than waiting for Google Calendar Sync to run its next synchronization, just tap the right button in the system tray app and select Sync. It doesn't get much easier than that. ICal synchronization with Google CalendarUPDATE: Since this post was written, Google has released a new utility called Calaboration that handles iCal-to-Gcal installation synchronization with even greater ease. (Original post) Mac OS X only: Google announced support for CalDAV in Google's calendar this summer, which meant that ... Read more about yesterday, Google Calendar supports two-year synchronization with iCal through the CalDAV remote calendar standard. You don't set up iCal with GCal a little bit depending on whether you're using the default GCal calendar or secondary calendar. First, here's how to set up Google Calendar by default with iCal:Open iCal, and then ignite iCal Preferences (iCal- Click on the account tab and then click I to add a new deleted calendar to calendar is all you want (I went with Personal for my main calendar) and then enter the username of the Google account (which is usually your Gmail address) and password. Click on the server settings to display the account URL text window. For the default calendar, enter the following URL: URL: youremail@gmail.com with your actual email address. Once you've done that, just hit add and you're finished. Give iCal a few minutes to download all your events and you're good to go. If you want to add a secondary calendar, the steps are exactly the same as the one above with one small difference. Instead of inserting your email address into the account URL described in Step 4, you need to grab a calendar ID for that particular calendar. You can find it by opening the GCal by clicking on the arrow next to the calendar Address section at the bottom of the window and then simply copy and paste the calendar ID (which is formatted as an email address) instead of youremail@gmail.com in the URL above. You can update iCal, to make sure you sync the latest and greatest at any time by selecting The Calendar - (Update or kick Cmd-R. (Original post) Sync Mozilla Sunbird or Thunderbird with Google CalendarWhether you use Mozilla standalone calendar app Sunbird or Thunderbird with the Extension Lightning installed (Lightning instal Thunderbird is basically the same procedure, and here's how it works: Download and install an extension provider, keeping it on your desktop, opening the Add-ons dialogue to either Sunbird or Thunderbird, and dragging the file you just downloaded into the Add-ons dialogue. Once installed, make sure to restart the app. Now that the vendor is installed, you have to add your new Google calendar wizard. Select Online and hit Continue. Select Google Calendar as a calendar type. The Location Field requires an XML taste of the private calendar address that you can get by opening the GCal and selecting calendar settings from the drop-off next to the calendar you want to access. At the bottom of the settings page, you'll see the Private Address section. Copy the XML link and paste it in the location box in Sunbird or T-bird. When you click Continue, you will be asked your Google Calendar username (again, your Gmail address) and password. Enter it, give your new calendar a name, and hit Continue. You're done. From now on, any event you add to this calendar automatically syncs with GCal and vice versa. You can reboot the calendar to get the most detailed information in time by clicking the Reboot button in the toolbar. (The button is installed in the default toolbar in Thunderbird, but you may have to set up Sunbird Sunbird add it to the toolbar.) Sync your mobile device with the Google calendar If you're interested in syncing your mobile device with the Google specifically for Gcal-to-BlackBerry sync. In addition, the free open source app GCalSync makes a two-way synchronization between Gcal and tons of supported phones. (Original post) Free GcalSync offers two-century synchronization between Gcal and your mobile device... More, if you're an iPhone or iPod touch user, you can set up automatic two-stop synchronization between Google's calendar (and Gmail contacts) with the NuevaSync website. (Original post) We showed you how to set up free push email, contacts and calendars on your iPhone, but for... MoreFinance, if your phone supports SyncML, the gooSync web app can handle Gcal synchronization without installing anything. Other options f you're not happy with the methods described above, which I chose because each is the easiest and cheapest (read: free) option- There are still tons of other tools to synchronize Google Calendar with the desktop calendar. First, we looked at how to synchronize Google Calendar and Gmail contacts with more technical GCALDaemon. In addition, the cross-platform Calgoo just went for free, with both Outlook and iCal synchronization capabilities. On a few unrelated but still useful notes, now you can also sync Google's contacts with the Mac OS X Address Book. Mac OS X Leopard only: Today's mac OS 10.5.3 release added a juicy little piece to deal with... More How would you like to get your GCal on your desktop? Let us know in the comments. Adam Pash is a senior editor at Lifehacker, who is not happy until everything is out of sync. His hack attack feature appears every Tuesday on Lifehacker. Subscribe to the Hack Attack RSS feed to get new installments from your news reader. Facebook does a really good job of reminding us when our upcoming events are or when our friends and family have their birthdays. It got to the point where I gave up trying to remember birthdays and just look at Facebook. The problem with which I run is that I don't spend all my time on Facebook, so if there was an easy way for me to see reminders of a service that I do, such as Google Calendar, it would be much more valuable. Enter: Synchronize Facebook events with Google's calendar. It's a simple process that will take ten minutes to top. Here's a step-by-step process: First: Go to your account and click Events in the left glass. Scroll all the way to the bottom and you'll see three links: Past Events, Birthdays and Export.Next: I'm going to show only birthdays, but if you want all the events, just click Export and skip this step. Click Birthdays. Scroll all the way to the bottom again and click Export Birthdays. A A will pop up. Finally copy the link and go to your Google calendar. In other calendars in the bottom left corner, select Add. then add by URL. Insert a link that you copied into the box. Voila! It's all set. The calendar will appear in other calendars as friends' birthdays. If you're on an Android device and go to the Calendar app, it should be listed. If the field is ticked, it means that it syncs with the Android device. Now you don't have to worry about visiting Facebook when you're worried about missing someone's birthday you may have forgotten. In order to set up an Android device, you must log in with a Google account. But you can also add more than one Google account, like a work or a second personal account. The good news is that adding a second (or third, fourth, etc.) Google account to your Android phone or tablet is a simple and streamlined process, no matter what phone manufacturer you currently use. While I will be using the Nexus device running a stock Android for this tutorial, you should be able to easily follow along basically on any of the Android phones out there today. Add an account from the Android Settings The first thing you need to do is go to the Settings menu. Pull down the shadow notification, and hit the icon cog (on the stock android devices, you need to pull the shadows a second time before the nook appears). From there, scroll down until you see the Accounts. On some devices, it can be called Accounts and Synchronization or something like that. Depending on how many accounts you've already signed up for on your device, the list that appears here can be quite long- just scroll down and there will be an add account link. Click on that. Again, depending on your exact setup, a lot of apps can appear here (anything that allows you find it, give this little guy a crane. If your device is protected by a PIN, template, or password, you'll have to enter it before you can continue. If the device supports it, you can also use a fingerprint. On the next screen, simply enter the information about the Google account is configured with two-factor authentication (and it should be!), then you'll have to wait for the code to come through. Once that happens, you're ready to go. Just click Accept. From there it will jump back to your home screen, but if you want to set up synchronized data (such as Gmail, app data, contacts, etc.), you'll need to go back to Google's account settings and then choose an account that you just added. Now you can fully customize what information you would like to sync. For example, I've added my work account where I don't need things like app data or documents, but I need Gmail and Calendar. Add an account from Gmail you can also add account directly from the Gmail app. From anywhere in the app, slide open the menu on the left side. You can also touch three lines in the upper left direction. With an open menu, click on your name and email address - there's a little arrow next to it. When this menu opens, click Add account. From here, just click Google. The rest of the process is identical above, so give that look. Take a look.
