Shutterstock Once your child enters first and second grade, you can reinforce basic measurement skills with these free sheets. She will get the practice of measuring in inches, centimeters, legs, yards, cups, quarts and pints. Use these printed forms to help you achieve your health goals. Click here to download Adobe Acrobat Reader. Step-list-wrapper title Use these printed forms to help you achieve your health goals. Click here to download Adobe Acrobat Reader. Step-list-wrapping title time Step-point number1. image_url title Activity Magazine Every time you do something active, pay attention to this form. Activities such as household chores and yardwork also include. Spend minutes and reduce the number at the end of the day. Download the Now number/step-element step-element2. image_url The name Blood Sugar Log Ask your doctor how often you should check your blood sugar, depending on your personal health situation. Use your own blood sugar log, or copy this form and fill out columns. Be sure to keep readings in your file folder: You'll want to look back at them to see how much you're improving over time. Download the Now/step-element number. image_url The name of the Food Diary - Print this form several times or duplicate columns in a notebook. For one week, write down everything you eat or drink, making a note of the time, portion size, and any relevant notes such as circumstances or what you felt at the time. Use nutrition labels to calculate the calories of packaged foods. Download Now/step-item (The Balance Everyday uses cookies to provide you with a great user experience About.com. Using balance every day, you accept our use © of cookies. There is no position except in opposition to another position. -- Mondrian Create your own version of the geometric painting Mondrian using this measured diagram as a template. Mondrian was an artist on porcelain almost all my life. Perhaps that explains his hatred of nature. ... (Mondrian) suppressed the curves and all the greenery because they reminded him of the trees he hated. ... In B the artist broke away from Theo van Dösbürg, who ... argued that the sloping line on a 45-degree slope was better suited to the dynamism of modern man. (Art of Our Century, ed Jean-Louis Ferrier, page 429.) You'll need: Print the template. You may find it easier to use large and small brushes for large/small areas labeled from 1 to 3. Or a separate brush for flowers from 1 to 3. What you're going to do: Print the template and paint it directly, or use it as a guide to mark the lines on a large sheet of paper or canvas. The black color should be reserved for areas marked 4. Paint in each area in a designated color, taking for care to make sure that your lines are straight and that the colors are not put in the wrong area. Tips: To get perfectly straight lines, use camouflage tape to make sure the paint doesn't drift where it's not needed. Don't forget to buy it in the right width, as it is difficult to cut the length of the tape in half evenly. The problems with the word can be complex for students, especially second-graders, who may still be learning to read. But, you can use basic strategies that will work with almost any student, even those who are just starting to learn written language skills. To help second-grade students learn to solve problems with the word, teach them to use the following steps: Review of Mathematical Task: Read the word problem to get an idea of its general nature. Talk to your students about the problem and discuss which parts are most important. Read the math: Read the question again. This time, focus on the specific details of the problem. What parts of the problem are related to each other? Ask questions about operations: Repeat again. Identify the specific mathematical operations that the problem asks you to perform, and list them on paper in the order in which they should be performed. The question yourself about the steps taken: View every step you've taken. Determine if your answer seems reasonable. If possible, check your answer to the book questions to determine if you are on the right track. Wrap it up: Scan the word text for problems that you will solve to identify any words you don't recognize. List them and define their meanings before solving problems. Write a short definition of the terms for your link while solving problems. After reviewing these strategies, use the following free word-printing problems to allow students to practice what they have learned. There are only three sheets because you don't want to overwhelm second graders when they are just learning to do word problems. Start slowly, review the steps if necessary, and give Students are able to absorb information and learn word problem-solving techniques at a relaxed pace. Printed materials contain terms that young students will be familiar with, such as triangle, square, staircase, dimes, nickel, and days of the week. D. Russell This printed includes eight mathematical word problems, which will seem quite verbose for second graders, but is actually quite simple. Problems on this sheet include problems with the word, formulated as questions such as: On Wednesday you saw 12 raspberries on one tree and 7 on another tree. How many raspberries have you seen in general? and your 8 friends all have 2 wheeled bikes, how many wheels is that in general? If students seem perplexed, read the problem aloud along with them. Explain that once you understand the words, it's actually a simple problem of adding and multiplying where the answer to the first will be: 12 raspberries and 7 raspberries 19 raspberries; While the answer to the second will be: 8 friends x 2 wheels (for each bike) 16 wheels. D. Russell on this print, students will work six issues, starting with two simple problems and then four more increasing complexity. Some of the questions include: How many sides are on the four triangles? and the man was carrying balloons, but the wind was blowing 12 away. He's got 17 balloons left. How much did he start with? If students need help, explain that the answer to the first will be: 4 triangles x 3 sides (for each triangle) and 12 sides; while the answer to the second will be: 17 balloons and 12 balloons (which blew away) 29 balloons. D. Russell This final print in the set contains a little more complex problem, such as this one involving money: You have 3 quarters and your pop cost you 54 cents. How much money do you have left? To answer that question, students survey the problem and then read it together as a class. Ask questions such as, What can help us solve this problem? if students are unsure, grab three-quarters and explain that they are equal to 75 cents. The problem becomes a simple subtraction problem, so wrap it up by placing the operation numerically on the board as follows: 75 cents - 54 cents and 21 cents.
