Lag is a problem in any multiplayer game, but when it comes to Fortnite, the slow performance of your network can be the difference between a Victory Royale and an instant death. While Epic Games' online Battle Royale Hit is well optimized for most Internet connections, even the best rig can suffer from delay problems from time to time. Although Fortnite's dedicated servers are optimized for the best possible gaming experience, you may experience problems when you encounter network problems at your end. Lag or high ping can have symptoms such as rubber banding or noticeable delays between your actions. Your ISP may also be the cause of the problems at your end, but there are a few troubleshooting steps that you can try to narrow down the possibilities regarding the cause of your connection problems. Here are some simple steps you can take to reduce Fortnites backlog and low ping as you struggle to become the last man to stand. Make sure it's delay, not your FPSImage over Epic GamesLag is not the same as a low frame rate, so before you fix your Internet connection, make sure your hardware doesn't hold you back. If you suffer from sluggish FPS during the game, it means that Fortnite's system requirements are a little too high for your system. Here are the game's system specifications. Minimum System Requirements Video Card: Intel HD 4000 on PC or Intel Iris Pro 5200 or equivalent AMD GPU on MacProcessor: Core i3-3225 3.3 GHzOS: Windows 7/8/10 64-Bit or Mac OS Mojave 10.14.6Recommended System RequirementsVideo Card: NVIDIA GeForce GTX 660 or AMD Rade on HD 78 70 or equivalent DX11 GPUProcessor: Core i5-7300U 3.5 GHzOS: Windows 7/8/10 64-bit or Mac OS Mojave 10.14.6Fortnite is well optimized for high-end and low-end computers, so you should be able to play Fortnite with any computer with these specifications, which has been created in recent years. But in general, 30 FPS is the bare Acceptable Minimum for the game, with 60 FPS or higher ideal. To check your in-game frame rate on your PC, open Fortnite, go to the settings menu, click the Video tab, and turn on View FPS. If your frame rate is the problem, you can reduce your graphics settings to improve your in-game FPS. Lowering the resolution, shadows, textures, and view distance will get the best results, along with setting the game's video quality to low. Screengrab via Epic GamesScreengrab via Epic GamesCheck the bandwidth of your networkImage via Epic If Fortnite does not suffer from a frame rate delay, make sure that the problem does not arise with your online connection. Look at your devices that are connected to the Internet and see if other programs offer your bandwidth. For example, if you play Fortnite on your PC, gaming clients such as Steam, Origin, GOG, and Battle.net in the background and with your internet connection, especially when they download software updates as you play. Make sure you close all live streaming services, such as Twitch or YouTube, that can throttle the download and upload speeds of your Internet. If you're playing Fortnite on PlayStation 4 or Xbox One, make sure all downloads are stopped while playing online. Your Internet connection may suffer if you install an update for another game while you are playing. Optimize your RouterImage via Epic GamesIf the bandwidth of your Internet is not a problem, then your wireless router may be responsible for Fortnite's delay problems. First, try to restart your router by disconnecting it from the power outlet and returning it 20 seconds before reconnecting. This causes your router to restart from scratch, effectively preventing that your router may encounter —and ensuring that your Fortnite ping is not sacrificed. Your router settings also have a feature called Quality of Service (OoS) that allows users to program their wireless connection to prioritize upload and download bandwidth for video games and other applications. By prioritizing traffic to and from Fortnite. Discord, and any other applications you may be using. OoS settings can stabilize your ping. The service quality instructions vary from router to router, but logging on to your router settings through your web browser should be all you need. For more information, refer to your router's manual or contact the manufacturer's customer service. While you are confused with your router settings, it may be advisable to check all devices connected to your router. Make sure you recognize each system on your network and change your password if you are unfamiliar. Last but not least, make sure your Internet connection is stable. If you completely terminate a wireless connection and replace it with an Ethernet cable, the Fortnite delay decreases significantly because you have a direct connection to the Internet. And if in doubt, never use a Wi-Fi hotspot or mobile data connection to play Fortnite – a dedicated, low-bandwidth private connection is always best. Make sure you play in the right region game game via Epic GamesScreengrab via Epic GamesLike Overwatch and PlayerUnknown's Battlegrounds, Epic Games uses dedicated servers around the world so players can play Fortnite smoothly and seamlessly. This that players in the US want to ensure that their game connects to American servers when they log on, while players in Europe want to connect to European servers. To check out the server region of your game, go to the Game tab in Settings, go to The Region Selection, and then set up the matchmaking region of the game area closest to you. For players who play Fortnite on yacation, make sure you change your region regularly when you fly abroad or otherwise travel to a region outside your home. While Fortnite automatically connects to your nearest matchmaking region, you should experiment with the settings and see if some regions can be connected more reliably than others. Try to change your matchmaking serverImage via Epic GamesFortnite Servers are not created equally. The game offers different regions for players to choose from, including NA-West, NA-East, Europe, Oceania and Brazil. By default, the game automatically matches the region that gives them the lowest ping, but that doesn't necessarily mean their ping is low when you jump into the game. If you're too far from the car region of the game for your connection, you may face devastating delays. The world isn't about Fortnite's server locations, and you can find yourself between regions like NA-East and NA-West. If you're at the same distance to two different matchmaking regions, try switching between them and seeing what provides the most stable connection. This is especially useful for players living in the Midwest and Southwest of America who may want to switch servers over a certain period of day, depending on the server load. Start your gamelmage via Epic GamesAlthough Fortnite has come a long way since its early days, can still detect bugs with gigantic content updates. Epic tries its best to fix these annovances as guickly as possible, but sometimes a simple reboot can be enough to get you out of the grip of a groundbreaking problem until the developer releases a solution. Restarting Fortnite solves all connection problems caused by a faulty line of code that only occurs after a few hours of gameplay, just as a router reset fixes most of the connection problems caused by your ISP. Check or install your gameScreengrab files via Epic GamesIf Fortnite has some intense delay issues, make sure your game is installed correctly. Open the Epic Games Launcher tab, click the device next to the Launch button, and click Verify. This causes your launcher to comb through Fortnite's data, verify its integrity, and replace it to ensure that your files were not corrupted when you downloaded them. If you continue to have delay issues, uninstall your version of Fortnite and re-energised them. If you download the game's files again, any files that have been installed incorrectly or otherwise corrupted will be repaired, which should wipe away any problems with the Fortnite delay. See if Epic has an outageFrom time to time, Fortnite: Battle Royale has server downtime or longer connection issues. For the former this usually happens when Epic provides a major update or patch, and the latter may come when an enormous number of players are online at the same time. So if you're pretty much behind or the matchmaking is still working, the problem may be out of your control, and the only solution may be to switch servers or take a break. If you want to check if Fortnite's servers have long connection problems, check down detector's in-game failure detection reports. The site monitors reports from users around the world and provides a live outage map so fortnite fans can check if their region is affected by longer server issues. As for major outages and issues that affect your in-game time, check Out Epic Status page, which plagues major incidents fortnite and reports when matchmaking, game services, parties and other features are affected by internet issues. Forward your PC or console PortsIf you are an old-school PC player, you can be familiar with port forwarding of fights delay in games like Counter-Strike and Battlefield. Port forwarding is an advanced technique that allows users to specifically communicate to a computer how network and to the Internet, optimizing communication for users on the client side. In other words, port forwarding optimizes your Internet connection by telling your computer and router how to talk to each other. Port forwarding can reduce the delay in its tracks by providing fortnite with a stable and consistent way to connect to the Internet so that your connection is as smooth as possible. It's relatively easy to set up, but there are a number of steps involved, including messing with your router's settings. To set up port forwarding, first access your router's back-end web site and go to the port forwarding page. Then grab your IP address for your device in question (e.g. your gaming PC or PlayStation 4), enter it, and add Fortnite port numbers for UDP and/or TCP ports, depending on your connection. For your router's TCP and UDP ports, portforwarding.com recommends opening the following ports for Fortnite: TCPPlayStation 4: 1935 and 3478-3480Xbox One: 3074Switch: 6667, 12400, 28910, 29900, 29901, and 29920PC: 5222 and 5795-5847UDPPlayStation 4: 3074 and 3478-3479Xbox One: 3074Switch: 1-65535PC: 5222 and 5795-5847Remember, you can open multiple ports at the same time, just make sure Fortnite Port is not already shared with another program or app. For more information about port forwarding, see the WikiHow quide Process that includes step-by-step instructions for forwarding ports on a router. Consider contacting your ISP and Epic Games If the above methods do not resolve your connection problems, you can contact the authorities. Your ISP and Epic will be the authorities in this case, and with your help they can find the root of your problems. Most ISP-related ISP-related contain faulty wires around your home or a defect between you and the nearest distribution center. Your ISP is most likely to send a crew to your home to inspect the cables, and they will handle the rest if they detect a problem. This happens more often in old buildings or in areas that are in a harsher climate. The feedback you give can also allow Epic to repair a faulty server at its end that you may have been connecting to all the time. Make sure you go through all the steps you've tried to resolve your connection problem with them and provide as many logs as possible. Possible.
