They use less water and energy when washing the entire value of dishes and pans compared to washing by hand. And since our hands cannot handle the high temperatures needed to kill bacteria, the results are also good. We tested 29 dishwashers from different brands, including high-end Miles and budget-friendly Beko models. These are our top performers: there are two questions you need to ask yourself before investing in a full-size vs slimline vs. integrated dishwasher dishwasher: how often do you use it and how much space do you have? As a guide, both full-size and slim dishwashers are 55cm high and about 55-60cm deep. However, the full-size dishwasher is 60cm wide and should fit in 120-150 items of crockery or cutlery, or 12+ location settings (some of the larger machines fit into settings in up to 15 locations). The slimline model is 45 cm wide and fits in 8 to 9 settings. The integrated dishwasher is really a matter of aesthetics and convenience. In independent models, the external and control panels are exposed. The integrated dishwasher is fully installed inside the kitchen unit and has a matching door in your cupboard. The control panel is hidden in the upper lip of the door. The semi-integrated dishwasher has a visible control panel, but most of the doors are covered with panels that match those in the kitchen. Energy efficiency All machines receive grading from A+++ to G, and A+++ is the most economical. The latest model with sensors is better than the old one, but the running cost will vary depending on the time it is running, how often it runs and the temperature of the water it is using. They will all have a normal, eco and intensive setting as standard. But since all programs have a specific purpose, it is worth knowing what each does: Normal: perfect for daily use, this cycle removes standard stains and food stains. This cycle uses 60-65C water. Eco: This cycle is ideal for lightly dirty plates and cutlery. It runs longer, but uses less water than a normal or intensive cycle. Water is usually 50 to 55°C. Concentration: Perfect for baked food. The water temperature is high and the inside of the dishwasher is clean. Delicate: Ideal for glass products and delicate China. The water temperature is lower than normal. Quick Wash: Perfect when you are in a hurry and the dish is not too dirty. The temperature will be the same as normal cleaning (60-65C). Hygiene: Ideal for items that need sterilization, such as baby items or cutting boards. This program washes at high temperatures. Sensor cleaning: The dishwasher has built-in sensors to adjust the program time, temperature and amount of water depending on how dirty the dishes are. Adjustable racks that you need to look for: Move the rack up and down to accommodate a large plate in the lower rack, or high glasses at the top. Automatic open door drying: The door opens automatically at the end of the cycle to let in fresh air and moist air. Collapsible cusp: The foldable cusp makes it possible to make more space for larger items. Salt and soy aid indicators: These let you know when dishwasher salt and soy aid need to be topped. Smart features: Some dishwashers connect to Wi-Fi, so you can control them through the app. You can remotely start, stop or put a delay timer in your dishwasher. Some high-end models can download extra programs, adjust strength and perform dishwasher diagnostics. In normal intensive testing, we lost a trail of low water and energy efficiency, but we earned the full mark of cleaning results with normal, eco-intensive cleaning. We succeeded in having 14 sets of crockery in this dishwasher, but the cutlery tray didn't have enough space for the last three spoons. With a wifi connection, you can start the cycle remotely and start sanitary settings to disinfect baby bottles and cutting boards. But it doesn't have an automatic open door dry that the winner does. This model got a perfect score in our usual, eco-friendly and intensive tests - everything was clean and dry at the end of each cycle. However, when set for an intensive cycle, its water and energy consumption readings were poor and hard to fit into all 14 location settings.
