Source: Search Wagoner/Android Center Screenshots are usually good enough to capture something you just have to share with others, but if you have a video or live stream you want to save a part to re-share - or if you need video to prove that an error actually exists and you're not just blowing smoke with the developer - the screen recording exists for you. I wish screen recorders were a standard part of the Android experience, but now, including some manufacturers, some don't, and then there are third-party registration apps to fill that gap. The most popular Android phones on the market - Samsung Galaxy S and Note lines - come with pre-installed screen recording, not knowing it by looking in the app drawers on your phone. But scroll up to the Quick Settings panel, there's a Hidden Screen Recording shortcut between Dolby Vision and Edge Lighting and Kids Mode and good sauce Samsung, do you have to put everything except the kitchen sink here?! Swipe down from the top of the screen to open the notification panel and save your screen to a working Samsung Galaxy phone. To open the Quick Settings panel, pull down the Quick Settings bar. Tap the Screen recorder between the Quick Settings buttons. By default, you may need to scroll to this page because the Screen recorder button is on page two. Source: Search Wagoner / Android Central A pop-up will appear asking which sound you want to record with your screen recording. Select one of the following: If you don't want audio with your recording, don't touch the sound. If you want to record the sounds your phone makes, record media sounds, but record the sounds you make. If you're recording a video from social media or safely live streaming, this is the setting you want. If you want to record your voice while recording your screen, tap media sounds and the microphone. Tap Start Recording. After the 3-second countdown, the recording begins. You'll see a timestamp with a stop icon in the upper-right corner of the screen. Tap the timestamp to reveal your recording options: Source: Search Wagoner / Android Central Tap the pen to explain to the screen. You can add comments in eight colors, and annotations disappear when you tap the pen again. Selfie, tap the contact to turn on the camera. You can move the selfie camera anywhere on the screen and tap the person again to zoom out. When finished, tap the Stop button to save the last and recording. Recording also ends automatically when your screen closes. Source: Search Wagoner / Android Central By default Samsung screen recordings are 1080p, but if you need to turn off the resolution to save storage space, you can turn it off up to 720p or 480p in the Settings app. Just search for the screen recorder. Source: Harish Jonnalagadda / Android Central Some other manufacturers include screen recording software Phones - OnePlus added last year, Xiaomi and LG were there for a while - but if your phone doesn't come either in the app drawer or with a Screen Recording option in Quick Settings, you can still save the phone screen quite easily. Instead, you'll need to download a third-party app to get the job done. Third-party screen recording apps abound, but you want to get an app that you trust. Screen recorders need permissions that can be exploited by developers with invading and less dignified intentions by their very nature. It's also useful to point out that screen recorders have to use a workaround to try and capture the sounds your Android phone makes while recording before Android 10, so which version will be connected to your phone's audio recording app instead of just the external microphone and you need a screen recording app on Android? These are our favorites. This is the most popular and stable screen recording app in the surrounding area, with no time limit on screen recordings, as well as options for live-streaming and editing your screen recordings. You'll need Android 10 to record device audio, but other than that it's a great screen recorder for recording game recording or tracks of a live stream. Google Play Mobizen also has the option to increase the maximum resolution for screen recording to 1440p so you don't lose your free (with in-app purchases) videos, and also add a personalized watermark so you can be properly credited when your video is shared. Free on Google Play (with in-app purchases) This screen recorder doesn't focus on compressing every feature of the app, which makes it a little easier to find your way in and just go in, start a recording, and continue the day. Every week on Google Play, the free (with in-app purchases) Android Central Podcast offers you state-of-the-art news, analytics and hot shopping with familiar co-presenters and special guests. Source: Joe Maring / Android Central In June 2020, Google launched a feature that Android users have been eagerly awaiting for years - Apple's AirDrop response. It came in the form of something called Close Share and allows you to easily share links to other Android users through an aerodynamic and simple process. Nearby Share now spreads widely across all Android phones, and if you're not sure how to use it, we'll accompany you through all its inputs and exits. Let's get started! The products used in this guide will take a look at how to round the ball, start Sharing Nearby on your phone to share something with a contact. If you have any it's as easy as sharing something through , and the whole process goes like this: Tap the sharing icon (it looks like three circles with lines connecting them). Swipe up in the Android sharing menu. Source: Tap the Android Central Nearby Share icon. Tap Open to enable Nearby Share. A person will call to share your nearby Share link. Source: Android Central All available phones appear on your phone (in this example, joe's phone). Tap the phone you want to share. Source: Android Central You can use Nearby Share to share links, files and other items on your phone, so feel free to play on your phone and use it to share all sorts of things. How to accept a Nearby Share on your Android phone If you're getting a file through Nearby Share, that's what you'll see. Tap the Nearby Share notification pop-up window. Tap Open. Source: Your Android Central Phone will search for those shared with you. Tap Accept to accept the share. Source: Android Central Once again, we're treating a very clean and simple user interface, making Nearby Share wonderfully easy to use. How to customize Nearby Share on your Android phone Now that you know how to use Close Sharing, when the time comes to start customizing the feature so it can work exactly the way you want it to. There are a few different things you can tamper with, and it's all worth the while. Open the Settings app on your phone. Scroll down and tap Google. Tap device connections. Tap Share nearby. Source: Android Central Tap your name to change which Google account you're sharing from. Tap device name to change your device's name when sharing something. Source: Android Central Tap Device to change who you can share visibility with. Tap Data to choose whether you want to use data, Wi-Fi, or offline sharing. Source: Android Central These last two settings are perhaps the most important, as they greatly impact how you can use Close Share. If you're sharing a sensitive file that you don't want accidentally falling into the wrong person's hands, you can limit Nearby Sharing to work only with specific people you choose. Also, if you don't want other Android users to be able to send you things, you can hide your phone completely from the service. The data usage page is also quite interesting, especially the option that allows you to share files without just an internet connection. This will slow down the process (especially for large files), but having it is a nice option if you are trying to monitor your data usage. Get our best equipment new Android features before anyone else If you want a phone that will get the latest Android updates as soon as they're released, the Pixel 4a is for you. Pixel 4a, this is perfect support, as well as a gorgeous AMOLED display, a premium camera and a buttered display Performance. Android doesn't have an iTunes-like desktop program, so synchronizing your data may not be as obvious as it is with an iPhone. However, you don't need a desktop sync app - even iPhone users are outstanding iTunes. While you can move files back and forth with a USB cable or wireless network connection, the ideal way to keep data equal between your devices is to rely on online services that do your job for you. Transfer Files Manually to Your Phone If you want to transfer files the old-fashioned way, you can copy the files directly to your Android device. This is ideal if you want to copy music, videos or other media files to your Android phone or tablet. After copying files, they should automatically appear in your Android media player app. You can also use a file manager application to view them. USB Cables: Connect your Android phone directly to your computer using the USB cable you use to charge it. In the computer window, it appears as a new drive to copy files from a USB flash drive. Older Android devices may require you to pull down the notification bar on your phone and tap Turn on USB storage to make it accessible on the computer after plugging in Android's storage. Wireless File Transfers: If you want to transfer files wirelessly, you have a wide range of options. AirDroid is one of the most convenient. Install the AirDroid app and you can access your phone from a web browser to copy files back and forth. You can also set up a Windows network or create an FTP server to allow your phone to access your computer's storage. Cloud Storage: If you want to copy files the old-fashioned way, for example, copy a video file to your Android phone, it's best if it's

too large. However, if you use cloud storage, it's easier to transfer small files and keep them even. Use Dropbox, Google Drive, SkyDrive, or another cloud storage service. drop the file into the cloud storage folder on your computer and open the associated app on your phone. This allows you to access the file without having to manually transfer the file to your phone or take any of your phone's internal storage space. There are third-party sync apps that try to replicate this iTunes experience with an Android phone, but you don't need them. Sync Your Browser Data Do you want your browser's locations, open tabs, history settings, and other data to track you between your phone and computer? Enable sync in your Web browser, install the appropriate browser on your Android phone, and enable sync there. Internet or Safari users do not have an official synchronization solution. Unofficial synchronization applications are available, but we haven't tested them. Get Music on your phone can connect to USB and copy all your music files to your phone, but it won't be ideal if there's too much music to fit on your phone. Instead, try using Google Music Manager, which will upload a copy of your music files to Google servers for free. Then, if you have an Internet connection, you can use Google's Play Music app on your phone to listen to your entire music collection or make music on your device accessible offline. You can also try using a third-party music app instead. Learn more about ways to get Android music without iTunes here. Use Online Services In the Old Days People synchronised their palm pilots and older smartphones with their computers to keep their people, calendar events and other data synchronized between their computers and hand devices. That's no longer how it works - in fact, you have to have trouble finding a software solution that synchronizes your data in this way. Instead, the data is synchronized relying on online (cloud) services, and Android does so by default. Your Android's contacts and calendar events automatically sync with Gmail's Contacts and Google Calendar, and you can access them from a web browser by signing in with the same Google account. Changes you make to Contacts or Calendar from your browser will copy them to your phone. Instead of worrying about synchronizing data back and forth, search for services with robust Android apps and handy websites or desktop apps, and use them to keep your data synced across your devices. For example, it's much easier to take text notes on your android and copy them back and forth using a USB connection, using the popular Evernote (or another note-taking app like Google's own Google Keep) to keep your notes synced on your devices. Assuming you use the same services on your computer and phone, it will be very easy to keep your data in sync. This section must occur automatically. Do you have any other tips for moving and synchronizing your data back and forth? Leave an answer and share! Image Credit: Flickr Flickr Johan Larsson
