## Conference call borderlands 2 farm

Conference calls are useful for organizing a meeting with a group of people in different places who need to make decisions. A group of lawyers may need to meet and decide on their client's case strategy, or a group of bachelorettes may be trying to plan a wedding shower. A conference call can help a group of people make decisions in minutes, which can take days to email and may not be possible to make it personal. Identify the people to be invited to a conference call. Then give preference to the importance of each person's attendance. If three or four people call a conference call, it's possible that priority may be given to the inviter's list. But if you invite six or more people, it's more likely that there will be planning conflicts. Make sure that important decision-makers can participate. Contact important participants to identify scheduling conflicts. Find out if and when those people will be out of town for a long time, on a plane and unavailable to make calls or otherwise not be able to participate. Arrange meeting times around these conflicts. Send an invitation to all attendees. Use e-mail, Evite, or other invitation software. Microsoft Outlook can schedule a meeting, send invitations, and allow invitees to accept or reject. You will soon get a common idea of who can participate and who can't. Invitees can have suggestions when they work better for them, and can send you agenda items to your responses to a meeting request. View the invitation based on the feedback you'd receive. Schedule a meeting using the call service. There are several companies that specialize in conference call hosting, such as FreeConference and InstantConference. If your business often schedules conference calls, find out if your company has a contract with a specific call service. Send a completed invitation to all attendees. Send an invitation even to people who declined the original meeting request if they become available later. Be sure to include all relevant information in the invitation, including the date and time of the call, the country code and the phone number that participants should use, as well as any necessary participant codes. Also add your contact number so that participants can contact you directly if they have problems dialing. Tips If you've never used a conference call before, ask about the clarity of your calls and the ease of use. There are some free services, and some have that fee. Compare the prices of paid services and decide which ones best suit your business's needs. Making an international conference call is not much different from a scheduled conference call. In fact, making international conference calls simpler than it seems. The same basic principles apply: participants collect call access numberThey enter the access code or PIN code at their conferenceThe only difference with the international conference call is that international participants need special access numbers to avoid paying expensive international call rates. Many larger conference call services offer an international free number to get to the conference. Others set local access numbers in countries around the world where customers usually do business [source: Premiere Global ]. For example, let's say you're in the United States and want to have a conference call with colleagues in France, Israel and Australia. All parties should dial either an international free access number or a local access number. The caller using a local access number instantly became entangled in the central conference bridge over the global IP network [source: Premiere Global Another way to save money by making international conference calls is to use a dial-out system instead of a dial-in system. When using a dial-in conferencing system, the conference call moderator calls each participant individually, covering the cost of each international call. This method is especially useful if the moderator has access to cheap international call rates, perhaps through voip service. The future of international phone calls is clearly going in the direction of VoIP. But people don't want to give up their landline or mobile phone number, we see a number of dual-mode phones that provide the best in both worlds. Dual-mode cell phones roam smoothly back and forth between the cellular network and the wireless Internet network. And dual-mode VoIP phones, as one offers Skype, can make and receive calls over landlines or the Internet. For more information about international calls and related topics, see the links below. Related HowStuffWorks articles AnyMeeting: AnyMeeting by Intermedia is an online conferencing service that includes a conference calling up to 200 callers.
