Scs-2u01 factory reset

Is your computer running slower than usual? Do certain programs not run correctly? Well, this may be due to a problem with your computer. Instead of bringing it to the computer repair site, you may be able to fix things by performing a factory reset. If so, you can save money on repair costs, all by keeping your computer in peak condition. Techopedia sets factory reset to remove user data from an electronic device and restore it back to factory settings. Typically, factory people reset their computer to fix a problem or remove all of their data from the machine. While most people just reset their computer when they experience problems or no longer need it, there is a case to do it more often, like every six months. When using the computer, it stores all types of data to use during operation. Some data, such as Word or Google documents and spreadsheets and downloaded photos, we chose to store. However, there is a long list of data that our computers store without us knowing. This includes: Browsing historySsemiticsastostasostasostasostasostasostasostasostasostasostas Over time, data accumulation will slow down your entire system, which can lead to some frustration. However, frustration is the least of your worries, as this data is more vulnerable to being stolen by malware, spyware, or hackers. As such, regularly doing a hard reset of your computer can improve your performance and security. Advertising Because the computer's factory reset will wipe all your data, it is best to back up that data before you start the reset. After backing up all your data, follow these steps to reset your desktop or laptop in Microsoft Windows 10: Press the Start button, which is the Windows logo found on the front of the taskbar, to open the Start menu. Select the Settings gear icon in the lower left corner of the Start menu. This will open a settings window. Select the Update & Security option in the Settings window. Select the Recovery tab of the left column. This will open the Recovery page in the Settings window. Press the Start button under the Restart this PC position. This will open a reset window of this PC window. In the Reset this PC window window, you'll see two options: Keep my files and Remove everything. Keep my files left your custom files intact while reverting applications and settings to their default configuration. The Remove All option will return Windows 10 to factory settings. After you select to keep or remove your files, the Reset window window in this PC window will display what will happen as soon as you confirm the reset. Select Next to continue with the process. Select Back to return to the previous choice. Select Cancel to end the process. Select Reset to the factory has restarted. If you are locked off your computer or Windows is not booting properly, you can get to the Reset window window of this PC window by selecting Troubleshooting in the Advanced Boot Tool. You can contact the Advanced Startup Tool: Restart your computer while holding the Shift key, or cycling on your computer three times the ad The time that a factory reset takes varies depending on how much data needs to be reset. Despite this variance, TechRepublic estimates two hours when selecting keep my files and up to four hours if you select remove all. One of the most useful features on modern devices, including iPhones, is the ability to factory reset them. This erases all custom information, settings, photos, and apps on the device and sets them to their default factory state. Typically, you do this when you are preparing to sell or recycle your phone, or if you are trying to repair a serious problem. The whole process takes several minutes to complete, although it may take longer in some circumstances. Before you reset your factory from your iPhone, you should know the risks of doing so. Many iPhones have default settings that require a unique unlock code after a reset, which locks many people from their phones. However, there are ways around this. Also, if you don't have a backup of your information, you may lose all the photos, videos, apps, and documents you can keep on your phone. MartinPrescott/Getty Images If your device isn't functional, you'll need to use iTunes on your Mac or PC to reset your iPhone from the factory. Make sure that you have the latest version of iTunes or you may not be able to reset your phone. You can update iTunes on a Mac by opening it and clicking the Apple menu. From there, choose system preferences and click Software Update. To do this on a PC, you choose the Help option in the menu bar at the top of the iTunes window. There will be a Check for Updates option in the menu. StockRocket/Getty ImagesTo ensure that you do not lose any of your phone's personal data, you must make a backup before resetting it from the factory. If you want to do this with iCloud, be sure to connect your device to a Wi-Fi network. Navigate to Settings and click on their behalf. From this menu, choose iCloud and then iCloud Backup. Then just tap the Back Up Now button. If you want to use an iTunes backup, connect your phone to your computer with a USB cable. Once iTunes finds your device, travel to the device icon in the upper left corner. This icon opens the of the device, and you can choose your phone. Look for the Backup section on the Summary page in the left menu. If you want to protect your backup password, check the iPhone Encrypt backup box, otherwise leave it unchecked. Click the Back up button now. Blackzheep/Getty Images One of the most important things you can do before before reset an iPhone is turning off Find My iPhone. To protect against theft, Apple requires a separate unlock code after a phone reset. Most people set this when they get the phone and forget it. When they try to restart the phone, they get locked, and there is little anyone can do to solve the problem. To turn off Find My iPhone, go to the Settings menu. From there, tap your name and then iCloud. Then tap Find My iPhone and turn it off. oatawa/Getty Images If your phone is still working, resetting is a simple and painless process. Open the Settings menu and travel to General. Then choose the Reset option. This opens a screen with a variety of reset buttons. To reset from the factory, press delete all content and settings. If your iPhone asks for your Apple ID password or password, enter it. Confirm that you want to erase your device. The process can take several minutes. Preto_perola/Getty Images You have two other options to reset your phone. The first is to use iTunes, but you must have synced your device with iTunes or found my iPhone at some point. This option also allows you to restart your phone if you forgot your Apple ID. Connect your iPhone to your computer with a USB cable. Choose your iPhone when it appears in iTunes. You can do this from the Device icon in the upper left corner. In the Summary panel, click Restore your iPhone, and then click Restore again to confirm. amesy/Getty Images If you've never synced your phone with iTunes or never had Find My iPhone turned on, you may not be able to reset your phone the normal way. Instead, you will have to turn off the phone and connect it to your computer. Launch iTunes. On older iPhones, hold the Home and Sleep buttons until you see a screen with iTunes icons and USB cable. For iPhone X and 8, hold the side button and don't release when the Apple logo appears. Keep holding it until you see the recovery mode screen. After that, iTunes should detect that you have a device in Recovery Mode and a pop-up will appear. From this pop-up, choose Restore to factory reset your device. pixelfusion3d/Getty Images If your phone has been stolen or lost and you are concerned about your personal information, you can still reset it from the factory. If you had iCloud and Find My iPhone enabled on your device, you can travel to the iCloud website or the Find My iPhone app on another device that shares the same Apple ID account. Select the device and click Delete. This will perform a factory reset on the device without it having to be nearby. PeopleImages/Getty Images reset your iPhone, you may want to restore your personal information. The first time you turn on your phone after a reset, it will guide you through the setup process. Once you've reached the Apps & Data screen, go to iCloud with your Apple Id. Choose to restore from anyone iCloud backup or an iTunes backup, depending on the backup you created. If you choose iTunes, you'll need to connect your phone to your computer with iTunes released. You can have multiple backups to choose from. Each of them has dates and sizes, so you know which one is the most relevant. Georgijevic/Getty Images When performing a factory reset of the iPhone, it is important to choose Delete all content and settings. However, the other options may be all you need. Reset All Settings protects your data and media by deleting only Wi-Fi settings and passwords. Reset Network Settings uniquely resets network settings, clears the cache, and removes any temporary files that your phone has stored on itself. Resetting the Keyboard Dictionary deletes custom auto-correct suggestions. Resetting the home screen layout sets the home menu to the default factory state. Reset location and privacy resets your privacy menu settings and location services. shapecharge/Getty Images Source: Jerry Hildenbrand/Android Central Factory Reset Protection (FRP) is a security method that has been designed to ensure that someone can't just wipe and reset their phone if you lost it or it was stolen. Starting with Android Lollipop, FRP is standard on vanilla Android, and most companies that make our phones have implemented it in their own models. It's a good thing - it makes a stolen phone harder to use, which makes it less attractive to thieves, and anything that can protect our data on a phone we lose is welcome. How it works it can become a problem if you sell, trade or even give a phone without resetting it from the factory, however. How it works explains why. You have to be logged in with the phone's proprietary account (the one you used to set it up) in order to reset it from the factory. That means if you give me your phone, I can't restart it without you being connected. There are random solutions on the Internet, but they tend to be fixed almost as soon as they are discovered. You'll need to know the login details of the last account to use your phone before resetting it and creating a new owner account. Source: Android Central We've been bitten by this ourselves. We ship phones all over North America and the UK, and sometimes it's easy to forget that you're still connected when you put a phone in a box. And yes, we end up having to share a password to pass the initial setup because of other policies that Google has in place to protect your account. This is a bit inconvenient, but generally, we remember the critical rule: If you change or reset your Google account password, you can't use it clean a phone that has been using it for 72 hours. Disabling it correctly Disabling Factory Reset Protection (FRP) is simple. On most phones, it will be done automatically whenever you choose to reset the data through the phone settings. If your phone has an extra layer of protection of the company that built it or has an app find my phone from the company that built it, you will want to disable it manually first. There may be some devices still in use that require a little more practical work. If your phone is really old, you may need to remove accounts that are signed manually. Open your device settings and remove any security you have to the lock screen. This is not a necessary step for all phones, but some want you to do it, so we're including here. Once this is done, you need to remove any and all Google accounts from your phone or tablet. This is also done in the settings—look for a section labeled Accounts. With an account selected, look for an option to delete or remove, usually hidden behind the three dots in the top corner of the screen. When you make sure that all Google accounts have been deleted, you can reset your phone or tablet from the factory through your device settings. On modern Android phones, there should be no problems as long as you choose to reset your factory phone through your settings. This will automatically remove all associated accounts to release the phone from the FRP. If you try to reset a phone through the bootloader, the FRP will take action and it cannot be set back without the previous account password. You can make sure that any reset protection has been removed from a phone for which you want to find a new owner. Try to get back to it after you restart it. If it asks for the previous username and password, FRP is still enabled. If that doesn't happen, you're ready to go: give it away and box it! Oops! Too late, I've already sent it. If you forgot to turn off the FRP and send a phone to someone else, you'll probably need to help them set it up. This means giving them access to your Google account password. The only other reasonable option is to return it so you can do it yourself. If you choose to let someone know your Google credentials, do so while you're on the phone with them. Give them your account password and make sure it worked, and they can continue the setup process. Then immediately change your Google account password, as well as any other accounts that might be using the same password. Remember not to delete or delete your Google account from another phone for 72 hours after you've done so! If you try, you may be locked out of your account and need to talk to someone on Google to resolve everything. While we haven't seen headlines telling us that cell phone theft has dropped by any measurable percentage since FRP was activated, it's still a good way to keep your data safe. And it's easy to disable when you want someone else to be able to use your old phone.
