Birthday cake candles python

You have decided that you will be in charge of the cake for your nephew's birthday and the cake will have one candle each year of her total age. When she blows out the candles, she will only be able to blow out the highest ones. Your mission is to find out how many candles she can successfully blow away. For example, if your nephew is three years old and the cake has a candle of height, you can successfully blow out the candle because the tallest candle is high and there is a candle. Complete the feature birthday cake in the editor below. It should return an integer indicating the number of candles she can blow up. The birthday cake candle(s) has the following parameters: ar: the first line of the array of integers representing the height of the candle contains a single integer representing the number of candles on the cake. The second line contains a space-delimited integer that describes the height of the candle in each integer. Prints the number of candles that can be blown off a new line. We have one candle of height, one candle of height, two candles of height. Your nephew blows out the highest candle, where the candle means . Because there are candles like that, we print them on a new line. ---------- solution ---------- #!/bin/python3 import math import os import random import counter # complete birthday cake candle feature below. def 생일 케이크 캔들 (ar): d = 카운터 (ar) largest_key = 맥스 (카운터.키 (d)) 반환 d.get (largest_key) __name__ == '__main__': fptr = 오픈 (os.environ['OUTPUT_PATH'], 'w') ar_count = int (입력) ar = 목록 (지도(int), 입력 ()).rstrip ().split ()) 결과 = 생일 케이크 캔들 (ar) fptr.write (str)+ "") fptr.close () -------------- 아래 파이선의 함을 확인하라는 경우 위의 예제 --------- 가장 간단한 솔루션입니다 (노란색 강조 된 대답은 위의 예입니다) #!/bin /python3 수입 수학 수입 os 무작위 가져오기 제수입 제왕립 #에서 제수입 def 생일케이크 캔들 (ar): __name__ =='__main__': fptr = open(os.environ['OUTPUT_PATH'], 'w') ar_count = int (입력()) ar = 목록 (맵 (int, 입력).rstrip ())) 결과 = 생일 케이크 캔들 (ar) fptr.write (str)를 작성 (결과) + '') 생일 케이크 촛불 - 랭크 헤커 솔루션 당신은 당신의 조카의 생일에 대한 케이크를 담당하고 각 년 케이크를 결정해왔습니다. When she blows out the candles, she will only be able to blow out the highest ones. Your mission is to find out how many candles she can successfully blow away. For example, when your nephew comes of age, there are candles on the cake. She can successfully blow out a candle because the tallest candle is high and there is such a candle. Complete the birthday cake in the editor below the feature description. It should return an integer indicating the number of candles she can blow up. The birthday cake candle(s) has the following parameters: ar: the first line of the array of integers representing the height of the candle contains a single integer representing the number of candles on the cake. The second line contains a space-delimited integer that describes the height of the candle in each integer. Prints the number of candles that can be blown off a new line. We have one candle of height, one candle of height, two candles of height. Your nephew blows out the highest candle, where the candle means . Because there are candles like that, we print them on a new line. Birthday Cake Candles - There are two steps for the solution to solve this challenge: find the maximum height of the candle. Calculates the number of occurrences of candles between all candles, and then prints this number. n = input () arr = map (int, raw_input().split ()) print arr.count (max (arr)) n = gets.strip.to_i height = gets.strip height = height.split().map (&amp;to_i) ans = 0 max_height = height.max (0.n-1).Each [i height[i] == max_height ans = ans + 1 end end printing ans import java.util.*; Public Class Solutions { Public Static Void Main [String[] args) { Scanner Scan = New Scanner (System.in); // Candle int n = scan.nextInt (); // Save the current maximum height of all candles, Initialize to the minimum possible height of the maximum height of the candle = 1; // Calculate the number of candles with maximum height = 0= n <(= 0; i ++) {int tmp = scan.nextInt (); if you read at a value greater than // maxHeight, (tmp > Maximum Height) { Maximum Height = tmp= Countmax = 1/ } // // If you read the same value as the maximum value (tmp== maxHeight) {// Max Increase////1/} System.out.print in (Countmax); } } Birthday Cake Candles - Hacker Rank Solutions Watch 19 Star 229 Fork 192 You can't do that at this time; you're logged in with another tab or window, reload to refresh the session. 자바 Bright API Birthday Cake Candle Hacker Rank Solution from Hacker Rank Solutions is a solution for a very large sum for C Hacker Rank Birthday Cake Birthday Cake Birthday Cake related to candle Sfcenterforspiritual development organization: Solution from Birthday Cake Candle Hacker Rank Python. Tags: Cake This is another simple problem from hacker rank called Birthday Cake Candle and here's how I solved it in Python.. Let me know if you have a better one. The problem is that you are in charge of the cake for your nephew's birthday and the cake is determined that she will have one candle every year of her total age. When she blows out the candles, she will only be able to blow out the highest ones. Your mission is to find out how many candles she can successfully blow away. For example, if your nephew is three years old and the cake has a candle of height, you can successfully blow out the candle because the tallest candle is high and there is a candle. Complete the feature birthday cake candle in the editor below the feature description. It should return an integer indicating the number of candles she can blow. The second line contains a space-delimited integer that describes the height of the candle in each integer. Related posts have you decided that you will be in charge of the cake for your nephew's birthday and the cake will have one candle each year of her total age. When she blows out the candles, she will only be able to blow out the highest candle, meaning height = 3 candles. Because there are candles like that, we print them on a new line. Sample Input 4 3 2 1 3 Sample Output 2 Description Candles of height 1, candles of height 2, two candles of height 3. Your nephew blows out the highest candle, meaning height = 3 candles. Because there are candles like that, we print them on a new line. Related posts have you decided that you will be in charge of the cake for your nephew's birthday and the cake will have one candle each year of her total age. For example, if your nephew is 4 years old and the cake has 4 high and there are 2 candles. Complete the feature birthday cake in the editor below the feature description. It should return an integer indicating the number of candles she can blow up. Birthday cake candle (s) has the following parameters: ar: the first line of an array of integers representing the candle height input format contains a single integer n that represents the number of candles in the cake. The second line contains an integer (n) with separate spaces, and each integer i explains the height of the candle i. Constraint 1 < n < = 10^5 1 < = ar [i] < = 10^7 The output format returns the number of candles that can be blown off a new line. Sample input 0 4 3 2 1 3 sample output 0 2 description 0 2 description 0 We have two candles of height 1 candle, 1 candle of height 2, height 3. Your nephew blows out the highest candle, meaning height = 3 candles. I print 2 on a new line because there are 2 candles. Solution #!/bin/python3 Import Math Import os Import Random Import Re-Import sys Import Collection # Complete the Birthday Cake Candle feature below. Def Birthday Cake Candle (ar): my_candles_counter = Collection. Counter (ar) max_height = Maximum (my_candles_counter.keys()) __name__ ===='__main__' returns my_candles_counter[max_height]: fptr = open (os.environ['OUTPUT_PATH'], 'w') ar_count = int (input()) ar = list (map (int, input).rstrip().split())) result = birthdaycake cans (ar) fptr.write(str)+') fptr.close()) somJANG/CODINGTEST_PRACTICE 1 1111 and later 2020.02.07.
