Wheel truing stand thru axle

04-12-2017 #1 have a Park bench rack, and were pleased with some old Problem Solver 20mm inserts. Now I need 15 and 12mm inserts, I read about various products, but there is no feeling for them. Any feedback esp from any bike shop people who are pushing a lot of bikes through their stalls? I regularly need 9, 12, 15 and sometimes 20. Thank you! DA Scottsdale Prop 420 Our Reservation, Our Taxes, Our Vote 04-12-2017 #2 04-12-2017 #3 Do you know if Abbey one works with boost hubs 15x110 and 12x148 DA scottsdale Prop 420 Our Reserve, Our Taxes, Our Voice 04-17-2017 #4 You Don't Need Adapters. Just use the axle from the bike. Even the 20 mm axle will fit into the notches in the bead rack. You're not 15, but you're 12? Take advantage of that. The wheel with still be level in the stand, and when the cinch rack on the endcaps, it will not move. 04-17-2017 #5 published by Scoth72 You don't need adapters. Just use the axle from the bike. Even the 20 mm axle will fit into the notches in the bead rack. You're not 15, but you're 12? Take advantage of that. The wheel with still be level in the stand, and when the cinch rack on the endcaps, it will not move. Logic is cursed. 04-17-2017 #6 You can use any solid rod that fits through the axle, anything wider than the shaft and will rest in V. I use a 1/2 x 12 drill, then rest it in two V's, and then tighten the axle clamp on the outside of the axle. 04-17-2017 #7 tried that, but I liked the inserts a little better - I'm not a great mechanic, I need good tools. Bought Abbey tool Maad recommended for \$50. It looked like a fun device to own. DA Scottsdale Prop 420 Our Reservation, Our Taxes, Our Vote 04-19-2017 #8 04-19-2017 #9 This^^^. A member of the forum, too. mtnbiker4life 04-19-2017 #10 originally published by rockman This^^^. A member of the forum, too. mtnbiker4life like looks like those (esp because I had 20s) but late to the party. My Abbey tool arrived today and I'm delighted at gadgetry it. Well worth an extra \$25. aaaaaand, does anyone want a second-hand 10mm thru screw and Hope hub 10mm inserts for a 9mm leg on a 100mm wide fork that is also an accidental 100mm journey? Who's going to pay me to publish ^^ on Stevabay? YES for Scottsdale Prop 420 Our Preserve, Our Taxes, Our Vote 04-27-2017 #11 Originally published by chollaball Do you know if Abbey one works with boost hubs 15x110 and 12x148 Our (Abbey) adapters work well with Boost, our adapters and most others that give up the size of the axle and are not affected by the axle gap. 12-07-2018 #12 Originally published by customfab Our (Abbey) adapters work well with Boost, our adapters and most others that are removed from the axle size and do not affect the axle spacing. @customfab, can you explain how Geiszler truing adapters fit into the Elevation of park TS with 142 and a wide width of the hub? Uprights do not open wide enough to allow outside the tool face sit in V notches upright. Make sense? Is this the correct setting? thanks- 12-08-2018 #13 I have the same problem with the Abbey Tool with my boost rear wheel in Park TS 2.2, so I just use the three-seater when squeezing the rear wheel. I don't like the Abbey Tool because of it, and on my boost front wheel it takes forever to unscrew the contrue pieces as well, making it painful to use. 12-08-2018 #14 Originally posted by mhopton @customfab, can you give an explanation of how Geiszler truing adapters fit into park TS uprights with 142 and wider hub width? The upright ones do not open wide enough for the outer part of the tool face to sit in the V notches of the upright. Make sense? Is this the correct setting? Thanks- It's a good way to use them. These stands are not built with shafts in mind and don't really open wide enough for many things. So, why did they revise it to keep up with the variable axle breaks. Originally published happyriding I have the same problem with the Abbey Tool with its boost rear wheel in Park TS 2.2, so I just use a run-down axle when squeezing the rear wheel. I don't like the Abbey Tool because of it, and on my boost front wheel it takes forever to unscrew the contrue pieces as well, making it painful to use. adapters to the hub is a great solution when you are doing serious work on wheels, and the wheel comes out of the stand to check the dish and de-stress and come back. If all you're doing is a simple real job you can put the adapters in loose, or better yet, screw them into your truing rack and let them tighten the wheel. 12-11-2018 #15 Originally published by customfab Screw adapter in hub is a great solution when you're doing a serious wheel job and the wheel comes out of the stand to check out the dish and de-stress and goes back in. That's the script I was describing. How do you use a dish tool on a wheel with an adapter still attached? What tool do you use? I just got Park WAG-4, and it's so much tighter than the piece of garbage I used before that it's a joy to use. But, I'm not sure the park tool will be able to get far enough around the Abbey adapter and touch the end of the hub. 12-11-2018 #16 this image shows Geiszler installed with a 15x100 hub in Park TS2.2. The tool is tightly threaded to the concentrate of the slob using the threaded rod that comes with it. I also use park WAG-4 tool to eat, see picture. Another image shows how to use a WAG-4 to eat at a stall. With Geiszler in place, use a large apartment on the outside of the tool face to set a dish gauge. I hope that helps. Sent from my iPhone using tapataalk thru-axle hubs just doesn't fit into the truing rack. Our adapters fit into the usual axle sizes so you can axle them just like a wheel with a wheel axle nodes. We've also included O-rings so that the axle plugs are flown into the hub for a firm fit and stay safe when you remove the wheel to check your dish and ease the stress of the spokesperson. Visit the help section or contact us professional wheel truing stand for QR /Thru-Axles multiple products in this description category due to its solid truing construction is designed for frequent use and is stable and safe at your workstation. Alternatively, the rack is also connected by screws to the workplace. Tightening the center, adjusting the centers and boom via ergonomic knobs. Solid steel construction Free standing or screw-on can be used Wheelsize: 20 - 28 with rubber 29 without rubber Suitable for: 9mm Fast edition Thru Shaft 10 - 20mm Hub width: up to 175 Edge width: up to 100 mm Height: 570mm Width: 210mm Length: 250mm 1 x Pro Wheel Truing Stand for QR/Thru-Axles Pro Series tools are designed for demanding bike mechanic. The tools must meet specific requirements in regular, multiple use in the bicycle workshop. High-quality raw materials, precision manufacturing techniques with low tolerances and careful quality assurance make Radon Pro tools reliable bike helpers. They assure through reliability, robustness and durability. Reviews habe ihn schon öfter genutzt, super handlich und top Great tool, very sturdy and comes at a great price! Plus: Der Ständer ist massiv gebaut, steht daher ruhig, angenehmes Arbeiten möglich. Adapter für Steckachsen sind im Lieferumfang. Minus: -Laut Beschreibung soll der Zentrierarm mit Führern kalibriert sein. Meiner rat es aber nicht, der Zentrierarm war 5-7mm ausssermittigt. Habe ein zentriertes Laufrad eingespannt, die Fixierschrauben für den Zentrierarm gelöst, ausgerichtet und wieder angezogen. Passt so halbwegs... -Die Arme, welche das Laufrad fixieren, darf man mittels Knebeilschraube nicht zu fest fixieren, führt unweigerlich zu einer Schiefstellung. Zusammenfassend kann man mit der Genauigkeit zufrieden sein, eine Zentrierlehre (Gauge) sollte man jedoch auch haben. Ich betrachte

den Ständer aber nicht als sogenanntes Profiwerkzeug. This is my first and only squeezing rack (with a squeeze rack), so keep in mind when reading this comment (also, see my comment Radon Centering Gauge for R513. Mechanically, the rack is quite robust and I have no doubt that it will last a lifetime. Unfortunately, I've only recently noticed a dent in my booth, I'm not sure if it's been there since arriving (so I don't take that into account for the stars I gave) It's likely that the stand will have to be calibrated before first use (this most likely happens during delivery). At least mine was far from calibrated so I had to buy a calibration gauge after that as well. Also, I have doubts about the longevity of calibration - I have already used it several times, but I had to do it every time. The upright hands remain calibrated, but a hand with (plastic) rim calibres is problematic to me. It comes out of calibration when moving between the table and the shelf or while it is stored on the shelf. So it's a bit tricky to calibrate it two adjustment screws at the base - you have to play a lot with it to get it within reasonable precision. Plastic caliber hoops also need a little attention when used - opening / closing the jaw is not completely symmetrical, it is somehow by steps, when at the first one side / opens closes a little more, and the other side will compensate only a little later. I think the final precision that can be achieved by the centered radon meter is about +/- (1-2)mm, if you set it really well. I think I've got about +/- (3-4)mm precision right now (including eating), so more or less fine for home use and if I buy/build really nice wheels I can get it even better. If you want better precision, be sure to try calibrating it with something better than a Radon Meter (or similar to a SuperB), but maybe the Park Tool 1554-1 calibration gauge will work better. The centering rack is massive and does not waver or squeal at work when you have it normally at the table. Due to the fact that it does not have measuring clocks, the wheels can be precisely centered up to 1 mm. Unfortunately, the boom wasn't centered in the middle of mine, which caused the first wheel to be a few millimeters to the left. However, you can move the boom horizontally by releasing two nuts from the front. Overall, however, the center rack is good for the house used and the fact that it accepts through axles and quick release - makes it very attractive for this price (€160). However, those who have high requirements and expect a perfectly calibrated measuring instrument with which to precisely center on a hundredth will not be so pleased with it. Deduction of 2 stars - because it is not calibrated and modest accuracy. But for me, that's good enough. My first center-back and first impression is very good... part is a tank and be full of confidence. The package leaflet is very clear. It comes pre-assembled and questions did not arise with 6 further screws. Park Tool's co-ordered DT-3 brake disc meter can also be easily fastened (usable accessories!). What you don't like (and you can read that online also via parktool centrifugal bleachers) that the stand at least wasn't out of the box and must be calibrated... it's embarrassing and how it wasn't explained on the package leaflet... here you can take money in your hand and buy centrist help or think about it and do something for yourself... recommended here at YT after stand centered search! I would still recommend the stand and buy it again at any time (if the house comes in... probably still surviving), it is also suitable for strength training with 8.5 kilograms. Stood well. He's doing what he's supposed to do. It takes a little dialing at first. Keep your guess that the 29' wheels only fit without rubber. They actually fit well with rubber like that (at least with 2.25 Rocket Rons). The centering rack makes a very high-quality impression. The description of the product is not accurate, as 29 impeller and rubber swell loosely. Centered hands can be turned up to 200 mm. This is probably not enough for Fatbike wheels, but there is an expansion adapter. The right recommendation for all hobby screwdriver! Tres bon outil,largeur d'essieu 175mm sensationnel.
