The Nice Clinical Knowledge Summaries Website (CKS) is only available to users in the UK, crown territories and british overseas territories. CKS content is produced by Informatics Clarity Limited. It is available to users outside the UK by subscribing to the Prodigy website. If you think you see this page for error please contact us. This guideline covers how upper gastrointestinal bleeding can be effectively managed in adults and young people aged 16 years and over. It aims to identify useful diagnostic and therapeutic steps so that hospitals can develop a structure in which clinical teams can provide an ideal service to people with this condition. In August 2016, we added a footnote to Recommendation 1.7.1 about proton pump inhibitors and H2 receptor antagonists licensed for use which are classified as off-label. Recommendations this guideline includes recommendations on: To who? Healthcare professionals people over the age of 16 suffer from acute upper intestinal bleeding, their families and caregivers is this updated guideline? We reviewed this guideline in November 2018. We have found no new evidence affecting the recommendations of this guideline. The process of developing the guidelines how we develop the Nice guidelines was previously called this acute upper gastrointestinal bleeding guideline: administration. The recommendations in this guideline represent the Nice view, which was reached after careful consideration of the available evidence. In exercising judgement, professionals and practitioners are expected to take this guideline fully into account, along with individual needs, preferences and values of their patients or persons using their service. It is not mandatory to apply the recommendations, and the guideline does not eliminate the responsibility for making decisions appropriate to the individual's circumstances, in consultation with him, his family and with the caregiver or guardian. All problems (adverse events) related to the drug or medical device used for treatment or in an action should be reported to the Medicines and Healthcare Products Regulatory Agency using the yellow card system. It is the responsibility of local commissioners and health-care providers to enable the application of the guidelines when individual professionals and persons using the services wish to use it. The government's decision to amend the Law on The Rights of The Child is a matter of concern. The reform, the need for a more effective and effective approach to the development of the united states is a matter of concern. Commissioners and service providers have a responsibility to promote an environmentally sustainable health and care system and should assess and reduce the number of elderly people who are numbered at 15 this year. The impact of implementing the Nice recommendations where possible. This is the first national guide in the UK to focus on acute lower gastrointestinal bleeding (LGIB) and has been commissioned by the British Society of Gastroenterology Clinical Services and Standards Committee (BSG). The guidelines group consisted of representatives from the BSG Endoscopy Committee, the Association of Colology of Great Britain and Ireland, the British Society of Interventional Radiology, the Royal College of Radiologists, the National Blood and Organ Transplant Health Service and a patient representative. Systematic research has been carried out in the literature, the quality of evidence is assessed and recommendations are classified in accordance with grade methodology (evaluation, development and evaluation of recommendations). These guidelines focus on acute LGIB diagnosis and management in adults, including risk assessment methods and interventions for the diagnosis and treatment of bleeding (colonoscopy, CT, anionography, endoscopic therapy, embolism and surgery). Recommendations on the management of patients who develop LGIB while receiving anticoagulants (including direct oral anticoagulants) or antiplatelet medications are included. It also discusses appropriate use of blood transfusions, including hemoglobin stimuli and targets. ...
