German shepherd black and tan

When most people think of the German Shepherd, they bring the common black and brown color spirit. But did you know that there are actually a variety of different German shepherd colors? The German Shepherd is one of America's most popular dog breeds, and there are a number of reasons why. In addition to being a loyal and wonderful family companion, the German shepherd makes an excellent working dog and has exceptional versatility. These dogs are known as guide dogs, police and military dogs, herding dogs, search and rescue dogs and drug sniffer dogs! These puppies are strong and muscular and they love to stay active. They are best brought up with a family who like to exercise so they can participate in the fun, otherwise they may be bored and frustrated when not kept entertained. Their personality can be a little distant and they may be wary of strangers, but when brought up correctly this breed is very loving and even gets on well with children! German shepherds are a medium to large breed of dogs. A male weighs between 75 and 95 pounds, while a female weighs between 50 and 75 pounds. Although they may be susceptible to some health problems, the German shepherd has an average life expectancy of between 10 and 14 years. A German shepherd has an average length or long coat, but did you know that this coat can come in thirteen different colors? Read on below to learn more about this beautiful breed and the different German Shepherd coat colours. History Of the German ShepherdThe German Shepherd was first discovered by Von Stephanitz who saw them at a dog show and decided that this breed was the perfect standard for a working dog. He adopted one of these dogs and named them Horand and then created the Verein für Deutsche Schäferhunde, the Society for the German Shepherd Dog.Horand was the first breed standard for the German shepherd breed and was bred alongside dogs of a similar appearance to give German shepherd nests. They are believed to have appeared in the United States in 1906 and were recognized by the AKC in 1908.German Shepherd ColorsLike many dogs, German shepherds come in many different colors. There are 13 different colors for the German Shepherd, although some are not as popular and can be considered errors by the large Kennel Clubs.The most popular German Shepherd colors are black and brown, black and red, black and cream and black and silver. German shepherds have one of two coats, either a medium coat or long coat. They are both double coats, with a more dense protective layer with a softer undercoat. When the German Shepherd first began to be bred, breeders focused not on the coat color, but on the size and construction of the dog, they were used as working dogs. However, later, more attention began to be focused on the coat color and some thought that a lighter coat color meant a weaker dog. Although this is not true, it is, breeds are still not recognized by the American Kennel Club (AKC). Fortunately, the United Kennel Club (UKC) allows pale and white German shepherds to take part in its shows. Like a puppy, German Shepherd are born with a coat that looks nothing like their adult coat! Their fur develops as they grow and will reach their final adult color at about three years old. Interestingly, each strand of hair has multiple colors, so no two German Shepherds are ever identical! Here are the thirteen most popular German Shepherd colors.1) Black and TanBlack and tan is the most common color combination for the German shepherd and is probably what you think of if you have a German shepherd image. The black and tan color is actually caused by a recessive gene. The black appears on the saddle and they can also black on their face as a mask. The tan coloration will appear their chest, sides, underbellies and on their neck. Black and brown pups will appear more black than brown until their adult coat has grown in at about 2 to 3 years old.2) Black and RedSimilar to the black and brown GSD, with a black and red German Shepherd the black color will appear on their saddle and on their face. Instead of a brown chest, side and underbellies, the color will be more of a strawberry blonde, although it may also be a dark red that is more pigmented than the brown GSD. This colorway is very popular among show dogs and is not often seen on working dogs.3) Black and CreamThe black and cream colors is, again, similar to the black and brown color for the German shepherd. In fact, it's just a lighter variation and is caused by a recessive gene, just like when people have blond hair. It is still presented in the same way across the body, with the black on the saddle and face. Because of this lighter color, these dogs are often not allowed to participate in dog shows because they do not meet the breed standard. However, they can participate in obedience competitions.4) Black and SilverThe black and silver German shepherds are also known simply as silver German shepherds. You will find the black color on the saddle and face of the dog, with the side and lower abdomen a silver color, very similar to the markings of the other GSDs we mentioned above. This color of GSD comes from the working bloodlines of these puppies. This is one of the least common colors for a German sheepdog. Again, because of their lighter color they are often not allowed to participate in dog shows. It is not known why this color appears, but it is believed to be down to a recessive gene.5) Bi-ColorThe two-color German Shepherd is another variant of the black and brown GSD. Although they are labeled bi-color, the majority of their jacket black and there are tan markings around their feet and legs, and maybe on their faces. It is said that the ratio of black to brown on these dogs is 9:1! Often, two-tone Gemran black German shepherds. However, if a GSD shows a sign of a different color on their fur, then they are considered a two-tone puppy.6) BlackThis dog must be plain black to be considered a black German shepherd! As we mentioned above, if there is a sign of a different color in this dog then they will be considered a bi-color dog. This color can be expensive and difficult to find because it is very rare. They are recognized by the AKC as a purebred dog and have the same origin in the other purebred German shepherds, but they are simply less common. A black German Shepherd puppy can be born to two black parents or a black and brown parent. The black pigment trait is not a dominant gene and is, interestingly, a recessive gene. It is often thought that black German shepherds have a right back than their different colored cousins, but this has not yet been proven as true.7) WhiteThe white German Shepherd is one of the most striking variations of this dog. There is a popular belief that these dogs are albino, but they are not and actually have a genetic disease known as albinism that is characterized by a lower rate of melanin production. The solid white color was deliberately bred by breeders and is not a genetic fault. However, it was seen as a weakness when bred by the working lines of the GSD, and is still to this day not recognized by the American Kennel Club.The white color gene is a recessive gene which means that both parents need to carry this gene to create a white German Shepherd puppy. White Shepherds usually have longer coats than other variations of this dog and therefore shed more. They are also a shearer and more skittish dog, but are very gentle in nature and make excellent family dogs.8) BlueThe blue German Shepherd is one of the rarest variations of the breed and can cost up to five times as much as traditional black and tan variations. This color is declared a serious flaw and therefore these dogs are not allowed to compete in shows, although they are recognized by the American Kennel Club.The blue pigment is down to a recessive gene and breeding them means that both parents need to carry the gene. These dogs often have blue eyes and their fur can come in three different variations - blue and brown, blue and sable or blue and black.9) GrayThe grey German Shepherd is often confused with the blue or black and silver GSD, but it is its own distinct color and is recognized by the American Kennel Club. The color is produced as a result of a dominant gene in one or both parents. The gray color comes from a dilution of dark pigment genes. Often these dogs are born with bright blue eyes that become a honey color or light brown as they grow up. These puppies not popular as show dogs, but because of their different color are popular as companion dogs.10) LiverAnother rare color variation, liver German German is bred due to recessive genes, which means it must be carried by both the father and the mother to produce a liver colored puppy. The liver color appears all over the German Shepherd and, unlike many colors in this list, has no areas of black on the saddle or face. The mask and saddle are actually brown, because the liver gene blocks the black pigmentation. This is another color that is not popular among show dogs and is thought to be a mistake.11) PandaThe Panda German Shepherd is one of the rarest variations out there! The look is exactly like the name - their coat looks like a panda coat! Contrary to popular belief, this dog is not a mixed breed and is a purebred German Shepherd.These puppies come from the working lines of GSD's and the mother will have pure black fur and the father will be of the black and brown color. The Panda German Shepherd was born out of a rare genetic mutation. These dogs still have the more normal black and brown color, but there will be white spots on their fur. In fact, about 35-40% of their bodies are white.12) SableThe sable color runs deep into the German Shepherd genes, with the very first German shepherd having a sable coat. It is caused by the agouti dominant gene and comes from working lines. The saber coloring is not a solid color and a single hair can actually be a mix of a lot of different colors. Each hair has a black tip, while the rest of the hair can be grey, brown or golden. This is why no two sable GSDs will ever look the same. Despite their history, they are still not as popular as black and tan German shepherds.13) Red SableRed sable German shepherds are very popular and these puppies can be easily found. A variation of the sable coat, these dogs also carry the agouti gene. In the red sable GSD, a deep red brown replaces the usual brown color in the sable pattern. The red and brown is spread throughout the body, as are the different colors in the sable dog we mentioned above. For this reason, there are never two red saber dogs the same. German Sheepdog CareGerman Shepherd's can be a handle to take care of. They have great care needs, a hungry appetite and need a lot of practice to entertain them. However, it is always worth it! You should make sure you are exercising your German shepherd for 60 to 90 minutes a day. This includes walks, games and mental games. Your doggy will want a big backyard to run around in too, so they don't get the exercise they need if you live in a small apartment. Without adequate exercise, they can develop unwanted and destructive behavior due to frustration and boredom. The German Shepherd is very intelligent dog and is therefore very easy to train. Their ease of training means they are a large family dog as well as a dog for couples

or individuals. However, they can be a little stubborn, so you should never punish penalties or scold them. If you are lucky and have a medium coated German shepherd dog, you will be able to get away with brushing them twice a week. However, if your dog has long hair, then you're going to need to brush them daily to avoid tying knots and tangles. They can also shed a lot, so their care needs can be difficult. Because the Shepherd is a big dog, their diet must also be great. It is recommended that you introduce them to a diet specially formulated for large dog breeds and you should always package the back of the dog food to see how much of a particular food you should feed your dog based on their weight. Experts recommend that a German shepherd should eat 20 calories per pound of body weight per day, which can come to about 1,500 calories. This is about 3 cups of food. Take a look below at the food we recommend for The German Shepherd.Best Dog Food For the German ShepherdDiamond Naturals Extreme Athlete Real Meat Recipe High Protein Dry Dog Food BUY ON AMAZONWe recommend the Extreme Athlete dog food from Diamond Naturals for the German shepherd. Formulated for very active dogs like the German shepherd, this food will ensure that your puppy gets all the nutrients they need.
