Read moreiOS: If you have a problem keeping to-dos with due dates from now on, the free Do It app (tomorrow) keeps you focused by letting you do tasks for (and moving them between) two days: today and tomorrow. The main idea of Doing It (Tomorrow) focuses on the tasks you have to do right now, and push it into tomorrow when you can't. Don't mess the list with end-of-week worries, nor distract you with different labels, labels, or to-do lists, it's essentially two pieces of paper that you can move tasks between with a tap of your finger. You may be able to find more information about this and content similar to piano.io Every time you decide to do some shopping on the Nintendo 3DS eShop, the device will ask you if you want to download your selected game at this time or at a later time. Writing these options may seem a little confusing, but you only wonder if you want to start downloading at this precise time (Now) or the next time you put the Nintendo 3DS in sleep mode (Later). One may be more manageable or even necessary, depending on what you are doing with the device right now. Nintendo The Download option later is convenient. On the one hand, downloading games in sleep mode is a little easier on the battery of your Nintendo 3DS. For another, you can queue up a few games to download. Then you can close your 3DS and make a sandwich. Whenever you want to check the status of downloads in the queue, all you need to do is open the 3DS. It's interesting how some things come full circle. In the early days of the web, browsers would automatically download links to files other than a web page, such as images, PDF files, and documents. Then, the browsers became so advanced that they were able to open almost any file in real time. This created a problem for developers, however. How would you force a browser to download a file, instead of opening it? A lot of hacks and solutions came up to solve the problem, but none was a real solution. That all changed with HTML5 when the Download attribute was introduced. Developers can now add a special download attribute to their HTML anchor tags to tell browsers to treat a link as a download, rather than opening the target file. There are a few different ways you can use the Download attribute to control how browsers manage download links. Even better, all modern browsers support the Download attribute, so you shouldn't see any problems with compatibility or the need for a backspace. There are some different ways to manage the Download attribute. Each has its own benefit, and all of them work smoothly through different browsers. The easiest way to use the Download attribute is just to include it in its most basic form in anchor labels. You do not need to include an additional filename or support information. The result resembles this: <a href=/path/to/download.pdf now! When including download you are telling any browser to read the page to download the destination link instead of opening it. In this case, the browser will download the file as it is with the same name. What if you really want to the name. There are a lot of times I would like to do that. Automatically generated filenames are a good example. They usually have ridiculously long names with strings of garbage characters. This is not the experience you want for your visitors. You can standardize things with the Download attribute. To specify a file name, set the download attribute equal to it. Exclude the file extension. The browser cannot and will not convert the file type, so there is no point in trying. Download now! Visitors will download the file as a file.pdf. Along with this comes a simplified way to let your users download images directly. This is not revolutionary, and you can probably put it together yourself, but you can use the download attribute to create a downloadable image link. Start by configuring an image as you normally do on your page. This, of course, will be the image that is available for download. <img src=/path/to/image.jpg alt=my image>Then encapsulate all of this in an anchor tag, linking to the image path. <img src=/path/to/image.jpg alt=my image> Finally, add the download attribute to the anchor tag. You can rename the image if you want. <img src=/path/to/image.jpg alt=my image> Now, when a visitor clicks on the image, they will automatically download it directly from the server. It's not necessary, and may seem like an exaggeration for a developer, but how many site visitors would think right-clicking on an image to view or download it? This?
