Autofill not working on mac

Remove automatic filling extensions not working is one of the recent issues that have occurred in Google Chrome installed on various types of operating systems, including some versions of Mac OS and Windows computers. The intuitive feature in Chrome helps you fill out web forms without having to type all the details in their entirety. Follow the solutions below to resolve the issue with autofill in Chrome. With a properly functioning function, you can quickly fill out web forms in your browser and give a little rest with your fingers. Sign out and sign in to your Google Account If your Google Server isn't connected to your Google ID, the feature may stop working. To try to fix this, sign out of your Google Account temporarily, close your browser, and restart the device you're using to surf the web. Then sign in to your account again and see if you can enter your username and password. Reset Chrome settings to chrome default reset settings If the workaround above doesn't fix autofilling, Windows or Mac PC users should reset their default Google Chrome settings. To do this, go to settings > advanced and click reset. A dialog box appears on the appropriate system prompting you if you want to change chrome settings back to default; confirm the reset after the line. Keep in mind that resetting your browser won't clear your saved passwords, bookmarks, and browsing history. Clear browsing data If you reset your browser, clear cookies, and disable add-ons, but if a Chrome reset doesn't fix the autofill problem, it's a good idea to clear your browsing data. To do this, Windows and Mac PC users must simultaneously press Shift, Ctrl, and Delete on the active tab, and confirm and click Clear Data when prompted. Remove the extension In case autocomplete stops working after installing the add-on in Chrome, the new extension may be to blame. Therefore, you should remove the defective add-on from your browser as soon as the issue comes to a notification. However, if you're not sure which add-on might have caused the autocomplete error, go to Settings > More Tools > Task Manager and end all extensions. Then turn them on one by one to find out what caused the problem with Google Chrome. Safari can automatically fill out forms, usernames, and passwords. If this feature doesn't work, here are some things to try. Make sure AutoComplete is turned on Check web page for forms A Web page may not have any fields to Autocomplete. If autocomplete still doesn't work, safari may not be able to match any of your personal information to the fields in the Web page form. For example, safari uses the information on the address book tab to fill out forms. If the form requires a phone number but the number isn't on the card, you'll need to fill it out manually. Another great new feature - - 11.1 now will not automatically fill in any login details, unless you specifically click on the first box, select the login drop menu, select login.... Is there any way to go back to the old method & prevent this full & complete waste of time every time? To clarify, after the comments. The Mac is unlocked, I'm sitting on it running. Security is not in dispute; if I leave the machine, i will either block it or it will self-lock. Any web site I visit that requires a log/pass [already saved in Keych crack, which is also open] then requires me to click in the first box. Safari then presents a menu for dropping credentials for this field. Then I have to click on it to fill in the fields. It doesn't improve safety, it just wastes time. This is by no means an improvement simply by automatically filling in the same information that they did until recently. I could understand this if there were potentially many entries to choose from; but that would be a case of edge not standard practice. Whether there are hidden text boxes is not a problem, because the data was previously manually entered into visible fields and then saved in the keychain. The keychain did not populate the fields with data that has not yet been saved for this page. This is not for autocomplete personal information – which already requires specific user interaction for good reason, just site-specific previously saved keychain/upload information. Community Support/Mac OS & System Software/Safari Looks like no one has responded for some time. To start a conversation again, just ask a new question. Question: P: Safari has stopped automatically filling in your username/password to sign in to websites. CNN and Tumblr are examples. Both previously would remember my login and even if i had re-Safari or my iMac and MBP, I didn't have to re-login every time. I would like to open a website and I will be automatically logged in. Now Safari has forgotten about it completely, and I need to log back to these sites every time. AutoComplete still works (autocomplete of user names and passwords is selected). I have disabled all plugins and restarted and it still won't work. Does anyone know about other things I can check to get this functionality back? I sue Safari 10.0.2 on macOS Sierra 10.12.2. MacBook Pro, macOS Sierra (10.12) Published on January 26, 2017 5:32 AM The answer I have this question too (151) I have this question too I (151) I also have the content of the page loaded Jan 26, 2017 6:00 AM in response to robertcoogan In response to robertcoogan How to click general safari safari change the setting from a new private window to a new window. If you still want, you can add . Jan 26, 2017 08:47 Am Reply Helpful Thread reply - more options January 26, 2017 10:52 am in response to tygb In response to tygb Nothing is added to login items. I tried to add it, and it had no effect. Jan 26, 2017 10:52 AM Reply Helpful Thread reply - more options January 27, 2017 1:14 AM in response to robertcoogan In response to robertcoogan If you previously stored your username and password for the website, Safari automatically provides information. Click the user name field, and then select a user name. If you don't have stored information for your site, do one of the following: If another site uses the same username and password, you can use the information stored on the site. Click the password box, click AutoComplete, and then choose Other Passwords. Select the website with the username and password you want to use, and then click Fill. If your site's username and password are unique, save them so safari can automatically enter them the next time. Enter your username and password, or generate a password (described below), and then click Save Password when asked to do so. Article : Safari for Mac: Use autocomplete for credit cards, contacts and passwords in Safari Jan 27, 2017 1:14 AM Helpful Thread reply - more options January 27, 2017 03:28 in response to tygb In response to tygb Safari remembers my username and password. What he doesn't do is automatically sign me in. Jan 27, 2017 3:28 AM Reply Helpful Thread Response - More options January 27, 2017 6:26 AM In response to robertcoogan If a password is displayed as never saved, Safari never fills it in automatically. To allow safari to automatically fill in your website password, remove it from this list. Article : Safari for Mac: Password Preferences in Safari January 27, 2017 6:26 AM Reply Helpful Thread reply - more options Jan 27, 2017 6:49 AM In response to tygb I went through the list of saved passwords twice now. I removed them and added them again. The problem still occurs. Jan 27, 2017 6:49 AM Reply Helpful thread response - more options January 27, 2017 7:39 AM In response to robertcoogan The above methods were based on the article, I'm not aware of what third-party application or antivirus virus is installed on your system as you never use or recommend about 3 rd party apps & anti virus. In users & groups > login options >automatic login is set to OFF . In case they are in your computer, they should uninstall .if the main problems are there in safari : Then, click on go to folder & type ~/Library Find cache folders, cookies, saved application status, safari (select all content except Bookmarks). Select content , & move to trash, restart m/c & empty bin . The fresh content will be restored. Web plugins - ins , input methods can not have content . Also refresh your browser , same in the user library > preferences > right click on com.apple.safari.plist & move to trash , restart & empty the trash , a new plist will be created, you need to set the home page once again, go to system preferences, some settings for the application will come by default, set them again. In safari preferences > extensions must be disabled & there may be no extensions. I'm not sure about any malware in your system, you can use Malware Bytes Anti – Malware for MAC, in communities the Etrecheck software is used & gives you the location of the malware in the system library user library & malware name. Jan 27, 2017 7:39 AM Reply Helpful thread response - more options September 1, 2017 9:11 AM in response to tygb Many people I know have the same problem, and techs at Apple just can't seem to find a workaround. My worked fine until the last update, now eventhough all information is in contacts and autofill is checked, none of it fills. Passwords do not, but not credit cards or information. It's annoying. September 1, 2017 9:11 AM Helpful Response (4) Thread Response - More options September 1, 2017 10:18 AM in response to breeoxd In response to breeoxd May be corrupted .plist. Make a copy 2 backups on 2 separate drives. Close the application. Go to the finder and select the user/home folder. With this Finder window as the front window, select Find/View/Show View or Go - J. When View is open, select Show Library Folder. This should make the user's library folder visible in the user/home folder. Choose Library. Then go to Move the .plist layer to the desktop. Restart your computer, open the app, and test it. If it works well, remove the plist from your desktop. If the application is the same, return .plist to where you received it, replacing the newer one. This may require resetting some other Preferences.Thanks to leonie for some of the information contained in this. September 1, 2017 10:18 AM Reply Helpful Thread Response - More options September 1, 2017 10:26 AM in response to breeoxd In response to breeoxd Sometimes it is better to install the operating system once again (first take back all the data). On Oct 1, 2017 10:26 AM Reply Helpful Thread reply - more options October 2, 2017 10:49 AM in response to tygb In response to tygb I put the autocomplete icon in my toolbar. Go to Safari/View and add the AutoComplete icon to the toolbar. Most pages no longer have autocomplete, so when I find it, I hit the autocomplete icon on the toolbar and then it works. I hope this helps. Oct 2, 2017 10:49 AM Answer Helpful (3) Thread Response - more options User profile: robertcoogan Question: Q: Autofill Safari not working
