The AVR-87 is an A/V surround receiver, letting you enjoy Dolby Digital and surround sound dts with maximum ease. To ensure all channels provide the same response - a vital requirement of both Dolby Digital and dts - the AVR-87 is equipped with the men in the field of measurable and comparable power. Sound effects associated with the action in the film will thus move around the listening space around you and greatly increase the sense of realism. The remote control that comes with the AVR-87 has an LCD that displays up to 10 characters of text. This allows you to easily create settings for system call and predefined memory based on requests. ■ Completely discreet, equal response and power of 75 W for each front channel 90 W + 90 W (8 ohms, 1 kHz, 0.07% THD) center 90 W (8 ohms, 1 kHz, 0.07% THD) surround 90 W + 90 W (8 ohm, 1 kHz, 0.07% THD) AVR-87 uses a high-capacity power transformer in the power circuit to support not only stable reproduction of 5.1 channel Dolby digital/voice dts But also pure, high-quality audio recordings. The completely discreet configuration of the ampere power segment provides equal power to the front left and right, center, and surround (back) to the left and right to ensure that everyone responds at the same levels. During surround sound transcription, the AVR-87 taps its powerful 75 W reserves for each of the 5 channels to surround you with a clean, realistic, refreshing sound. ■ DDSC-Digital (discreet-digital dynamic surround circuit) Because surround signals are all rendered in the digital realm, the AVR-87 is equipped with a

newly developed, sophisticated, high-performance DSP circuit for Dolby Digital, Dolby Pro Logic, dts decoders and surround simulator. D/A converters feature high-resolution designs for all front L/R channels, center, L/R, and subwoofer. This combination of DSP and D/A converters works to bring out the enormous potential of Dolby Digital and sound dts. In addition, high-resolution A/D converters have been integrated into the Dolby Pro Logic decoder. The high sound quality of the new DDSC-Digital is partly due to high-quality signal processing of the 24-bit and 96 kHz (DIR) digital interface receiver. AVR-87 not only allows digital signal input from DVD and other advanced media to go directly to DIR, it also processes them while maintaining their integrity, so does the most subtle nuances of music, reflecting the emotions of the artists, delivered without allow to the Digital Signal Processor (DSP).
