Village of niles water bill

Despite egypt's somewhat inhospitable physical environment, it is the second most populous country in Africa -- thanks in large part to the Nile. In fact, more than 95 percent of Egypt's population lives on the banks of the Nile, although the region accounts for only 5 percent of Egypt's land area. As such, the Nile Valley is one of the most densely populated areas in the world, with an average of 3,820 people per square mile [Source: National Geographic]. The Nile remains the lifeblood of the countries through which it is studied. Farmers produce a variety of crops, including citrus fruits, cotton, wheat, sugar cane, legumes and sorghum. Despite the relatively successful agriculture programme, the countries through which the Nile flows are still poor and their population swells. The Nile Basin Initiative was launched in 1999 to help each of these countries benefit from the Nile and its benefits. The Nile is also used to enhance hydropower capacity. Although plans are still under way to further develop electricity production in the region, several dams have already been built to control floods and generate hydropower. The Nile has also been frequently portrayed in major television and animated shows, including The Jewel of the Nile (1985) and The Simpsons. The magic of the Nile captures the imagination of the world. Related Articles of HowStuffWorks: Africa. Date.com. Egypt. Encarta. Un Egypt Online. John. West Nile virus is a disease transmitted to humans by the bite of an infected mosquito. The mosquito initially gets the virus from biting the birds that carry it. Related studies indicate that up to 80% of people with West Nile do not show symptoms and never realize that they have been infected. Symptoms that usually appear go away on their own, but most acute issues can develop and require immediate medical attention. When people show symptoms of West Nile, they may first think they are suffering from influenza. Some people develop fever for no apparent reason. This affects about 20% of people living with HIV. Nausea occurs frequently along with fever. Fever is usually low grade, although it can be higher in severe cases. Symptoms of fatigue, generalized aches, and loss of appetite may also be present. Moyo Studio/Getty Images Some people with West Nile virus symptoms complain of joint pain. The infected person's joints may become unusually stiff and painful, and feel warm. This pain may appear along with flu-like effects, although it may also develop as a singular introduce. Some people confuse joint pain with joint inflame, while doctors may confuse the symptoms of another mosquito-borne disease: chikungunya. Joint pain and swelling are more common with chikungunya than West Nile virus. In addition to flu-like symptoms and joint pain, people with West Nile may prescribe other aches, including severe headaches that have begun at the base of the skull. Some experience the neck, upper back, or arm pain. Fatigue is also common. Some people report spending most of the day in bed without energy to get up. Cecille_Arcurs/Getty Images inside the body are many lymph nodes that play an integral role in the fight against infection. They act as special filters capable of trapping viruses and bacteria before they cause disease. Lymph Inflate because they work hard to contain bacteria, viruses, or other harmful invaders. In this case, the invader is a virus. West Nile virus primarily affects the lymph nodes in the upper body, which may develop constant pain, especially if it is excessively enlarged. FatCamera/Getty Images Some people with symptoms with West Nile infections develop a red rash. It primarily affects the body's torso, specifically the upper back, neck, and chest. In some individuals, the rash spreads to the top of the arms, legs, palmhands, soles of the feet or face. If the rash is particularly severe, it may extend across the trunk and entire extremities. It is usually marked with small, red or flat dots with pink or red discolor. Voyagerix / Getty Images If West Nile infection is severe, a person may develop symptoms similar to those of neurological diseases such as encephalitis or encephalitis, meningitis, an inflammation of the membranes around the brain and spinal cord. Some people with encephalitis or meningitis in West Nile also develop other symptoms, starting with tremors and confusion that can lead to coma and death. Fortunately, this is rare. Only one percent of west Nile virus patients develop the involvement of the nervous system. Dr_Microbe/Getty Images In a severe case of West Nile, where the disease affects the nervous system, people can be stunned. A dazed person may appear conscious but not fully responsive. Some people have open eyes that follow moving objects, but pain may be the only triggers that can provoke a reaction. Bright lights, loud noise, and other shock causes may also cause a response. Kupicoo/Getty Images Other neurological symptoms of severe cases of West Nile is muscle weakness that eventually leads to flaccid paralysis. This is the result of an infection attacking the nerves that control the muscles. As the infection spreads, the muscles gradually become weaker, eventually becoming lame and losing their ability to contract. If paralysis reaches the respiratory muscles, the symptoms can be fatal. Gilaxia/Getty Images Possible symptoms of West Nile infection is splenomegaly or enlarged spleen. As the lymph nodes swell to fight infection, the spleen can also swell. Research shows that the West Nile virus is transmitted to the spleen and lymph nodes, where it replicates to produce more viruses. In many cases, there are no symptoms of splint, and the doctor will only notice during diagnostic tests. Symptoms that develop may include pain or pain as the size of your spleen presses on the stomach. Anemia, easy bleeding, fatigue is also possible. Additionally, because the spleen is one of the first lines of defense in the immune system, and the lack of spleen, in people who have been removed, the virus helps to get a stronger foothold in Body. Jean Otto/Getty Images Rarely, West Nile virus can lead to other conditions and diseases, including: pancreatitis is pancreatitis that can cause abdominal pain, fever, rapid pulse, and nausea. Myocarditis is an inflammation of the heart muscle and negatively affects the organ's ability to pump blood. It can lead to arrhythmias, strokes and heart attacks. Optic neuritis is an inflammation that damages the optic nerve. This can cause eye pain, loss of color vision, and complete loss of vision. Hepatitis is hepatitis, which can lead to diarrhea, nausea, jaundice and loss of appetite. Severe complications include cirrhosis and liver cancer. Milkos / Getty Images Many apartment dwellers pay a monthly water bill as part of their utility payments. The average water bills vary according to several factors, such as the United States area where the owner lives, the amount of water they use, and the size of their apartment. Apartment residents can reduce their monthly water bills for a lower average bill. The average monthly water bill has several costs rolled into one go. In the first place, your water bill consists of the fees due to you using the water inside your home. The water bill can include another monthly fee. For example, many help service providers charge a monthly service charge on your server. The company based this service fee on the size of your water meter and pays the same amount each month. Some utility companies may also charge conservation fees for your frost. These fees go to pay state fees for water treatment plants. Many cities include sewage and waste removal fees on your water bill. These fees cover the cost of sewage and garbage treatment for your home. The average monthly water bill for the apartment depends on several factors such as local prices, size of apartments and water use. Local rates vary by city and state. LeakBird reports that as of March 2009, water rates in major cities range from \$2 to \$3 per 748 gallons of water. Small towns and suburban areas may have a lower water rate. The size of the apartment is also factors on average. Large apartments, especially with more than one bathroom, may use more water than a smaller studio apartment. Personal water use plays the biggest factor in the average water rate for an apartment. Usually, residents of apartments use water for bathing, flush toilets, washing dishes or washing clothes. If the apartment has two people, a washing machine and a dishwasher, the monthly average is likely to work higher than a studio apartment with one occupant and no main appliances. Apartments with outdoor grassy areas requiring frequent watering will also have higher average water bills. Apartment owners can reduce the average water bill costs by monitoring water use. For example, by running the dishwasher or The device only when the hardware loads full, the occupants will use the devices less. Less device use means less water use. Occupants can also reduce the number of showers that take or take shorter showers. By doing so every day, they will see a reduction in water use. Use.
