WebBrowger incorrectly parsed the HTTP response content obtained as XML instead of HTML due to incorrect or missing HTTP response content type. In the case of JSF/Facelets files, which have a default extension of .xhtml, it may in turn be if the HTTP request has not applied facecancerlet and thus it was not able to parse the facelet file and generate the desired HTML output based on the XHTML source code. Firefox is then only estimating the HTTP response content type based on the .xhtml file extension that is in your Firefox configuration, which is interpreted as text/XML. You need to make sure that the HTTP request URL, as you see in the browser address bar, <url-pattern>matches the registered facial service in the web app's web.xml, so that it can be applied and able to generate the desired HTML output based on the XHTML source code. If it's the example *.jsf, you need to open the page instead of /some.jsf/something.xhtml. Alternatively, you can also change to *.xhtml just <url-pattern>. This way you never need to fiddle with virtual URLs. See also: JSF</url-pattern></url-pattern></url-pattern>/url-pattern> Sometimes I see that the URL is .jsf and sometimes .xhtml. why? Thus note that you don't really need xml stylesheet. All this was misinterpreted by WebBrowser, while doing its best to submit some of the reclaimed HTTP feedback content. It really should have achieved properly generated HTML output, Firefox certainly knows how to deal with HTML content. Avoid support scams. Thank you for your answer, I mess with things I don't know what it does. But he salve my problem. Such an empty page can be caused by too much memory consumption. Do you have a lot of categories? Xml sitemap administrators try to reduce the maximum conditions on the page (Classification tab) > your settings. yes I've put several categories ive 100 per sitemap only 100? That should not be a memory issue. ⌐ Something else will be going wrong. Do you have access to your server/host error log? I then, what message does it show there, right after going to your category sitemap? Oh, wait. I see an error in your range response source code: Fatal Error: Memory size of 134217728 bytes allowed has expired which means php permission merory was filled ... I've seen 500 entries in your tag sitemap. Does this mean that you have the maximum conditions number now at 500? Or a big number still? What happens if you reduce the maximum number of conditions for example to 50? When I put 50 I'm a blank page should its not have a memory issue, ive a dedicated server with lots of juice if you open your range sitemap and the source (Ctrl +u) will see you finish a fatal error: allow memory size of 134217728 byte... Error message. This means that your server's PHP memory is limited to 132 MB. That's why I asked to see what happens if you significantly limit the number of classification terms in the sitemap. If it starts working again, increase that number to 100 in steps to see when it stops working. Or, if you can, set the hard memory limit to 256 MB. Nevertheless, your current memory should normally be sufficient to create a sitemap as a classification of 1000 words. Is there another plugin that's hogging a lot of memory somehow? A?
