If your heater is out of warranty, sometimes it's only cheap to do it yourself. If you are yourself in this scenario, this blog post is for you. This blog post discusses the most common swimming pool heater problems that pool owners may encounter and what measures to take to fix the problem. My heater is one of the most common problems with pool heaters is that it fails to ignite. Is the heater turned on and the temperature set correctly? Your pump is moving with a clean filter and basket or check the pump and filter and clean if necessary. Make sure the pilot is lit (millivolt heater). If the pilot is not lit, check the gas pressure, air supply, and proper air flow. Make sure the pilot tube is stuck as is. For MV heaters, if the pilot does not remain lit, check the output of the thermoso charge. Is the gas supply valve in the on position? In the case of supplyturn it off and turn it on. Are piping and filter valves open? For low-flow heaters to operate smoothly and efficiently, it is important that the pool system maintains a consistent flow of water. The manufacturer equips the swimming pool heater with a pressure sensor. These specialized sensors monitor and detect changes in water flow. For example, the LCD screen of a heater might display a low water flow warning. Or you may notice that the heater is not pushing out the warm water you need or you are getting used to it. Honestly, this is a very common occurrence. If the water flow is low or the heater does not start, ask the following question: Have you recently cleaned the filter? Monitor the PSI readings with the filter pressure gauge. If the PSI is too high, clean the filter. Increasing pressure goes hand in hand with reduced water flow. Is your pump basket dirty? Remove the basket and remove the debris with a hose. Make sure the pump basket and lid are in good condition. There are no cracks. Are there too many water features that work at once? If possible, replace the motor with a larger motor. Close the water features or alternate them until the pool heats up to the desired temperature. The purpose of a (most common) pressure switch with a defective pressure sensor/switch is to make sure that water is flowing through the unit before turning on the heater. The pool pump must be turned on and the filter must be clean so that the switch closes and voltage passes through. Test the voltage reading of the pressure switch with a multimeter. Replace the pressure switch if necessary Are you using the low setting of the variable speed pump? If you are running a variable speed pump with a low setting, make sure it meets the minimum GPU of the heater. The pool heater turns on and off (cycle) If your swimming pool heater is cycling on and off, it indicates early that there is a problem with the electrical connection or power supply. But that's not always the case. There are other factors that can actively contribute to the on and off cycles of heaters. Is the chemistry of water in the pool consistently and accurately balanced? Test your water before adjusting your chemical levels. If you are uncertain, refer to the recommended chemical level heater manual. Have you inspected pressure sensors, thermal adjusters, and/or high limit switches? IfSensors, thermal adjusters, or high-limit switches are defective, corroding, or defective - replacing it. Have you cleaned the filter? If the filter is dirty, it will cause low pressure, resulting in the heater pressure switch turned off. Dirty filters can prevent the heater from firing and can also cut off the heater before the heater warms the water to the required temperature. When was the last time the heat exchanger was inspected and cleaned? Inspect the heat exchanger for chemical or disinfectant damage. The pool heater does not heat Sometimes the pool heater ignites, but does not reach the desired temperature. Or the heater may not be generating heat at all. Both situations are very common. Check the temperature sensor. Install the temperature sensor correctly to make sure it is in good condition. Set the thermostat settings to a high temperature for the reconfirmation thermostat. Have you set the size of the pool heater properly? It is recommended to oversize the pool heater to minimize the time it takes to heat the pool.
