Not all root processes can work perfectly because they also often find some limitations while the root process is running. This problem turns out to be a solution, here are some of the following solutions: 1. If the application fails to install, then turn off the Internet connection first. If it is successfully installed, continue by restarting your Internet connection. 2. When the process of rooting takes place, the smartphone itself is restarted, it is best to open Kingroot, so that the root process can run again. 3. Try repeating the root process up to three times. 4. If the update process takes too long, close Kingroot through task manager or can also turn off the phone and resume the application There are some advantages to android that have been performed at the root process, the following are: 1. Moving Data and applications to the SD card In general, the smartphone can not move the data and applications to the SD card. This condition will automatically make internet storage full quickly. The workaround for this issue is to use multiple applications such as Xinterna!SD, FolderMount, APP2SD, and so on. However, there is a note that the smartphone is already at the root. 2. System manipulation After rooting, it turns out that smartphone users can manipulate the system that is Android. For example, using programs like Hide Mock Location, Hide root, Fake GPS, and so on. Later, if using one of these applications, then the user can manipulate the location of its existence. This can be very useful for several reasons.
