## Gerardo medina now

I remember reading about this in the 1980s in the Guinness Book of World Records. I was a kid myself, so this story bothered me. I wasn't shocked; the story filled me with surprises. How did it happen? I'll never forget the image of the girl/mother with her baby and the doctor, so when I saw this picture this morning, memory clicked. The story again appeared in some other research that I've done. Yes, the shock of being a mother to a five-year-old girl is a wonder to herself how the human body could have made it possible. The hormonal imbalance was responsible for her remarkable development, which made it possible for a five-year-old to become pregnant, carry a pregnancy and give birth. Which aside, it is terrifying that a man would have raped and raped a young girl - who knows how long it was going on - for her to get pregnant. The father of the girl's baby has never been identified. After the birth of the girl's son in 1939, her daughter and baby lived in Peru as the children of a family of parents from two parents' families. But they were allowed to live together as a family. There was no way they would stop them from holding the baby, she grew up as a sibling for her five-year-old mother, and the two told the truth at the right age times. That means they're kind of normal for their lives, which means the boy knew the real circumstances of his birth, and the young mother had to deal with being a mother at an over-young age, and the pregnancy was caused by rape. We don't know all the specifics. How did the girl's parents explain to her that she was a mother? How did he accept this fact and what age of pregnancy and birth and the state of motherhood he understood for a boy who was five years younger than him? How did his son accept what happened? Obviously, there was not much to do with the involvement of government agencies or social services or religious institutions to make matters worse for this multigenerational family. Read the story to yourself. Then compare what happened in Peru in 1939 to today's childcare, nurturing and adoption systems in the United States. If something like that was going to happen today in the good old USA, the five-year-old girl would be ripped from her parents and put in foster care and then released for adoption. If she continued her pregnancy and carried the baby to full-term birth, her child would also be torn from her. The forced abdication took place because it became clear that the mother of five would not be able to parent her own child (obviously) and her baby would be forced into adoption by strangers. The whole family was separated by two children in foster care and two children in possibly separate adoptions. The result would be adding unnecessary blows over the main hit. Separating a mother from her No matter how young the mother is, in my opinion, it's not the best course of action. For that matter, separating the child/mother from her parents is also not the best course of action, but what is happening to teenage mothers and their babies in America today. May God pregnant every mother younger than a teenager in today's America. -- Joan M Wheeler, BA, BSW, author of Forbidden Family, Trafford Publishing, Nov 2009. 03 December 2005, a man from a small village in the Andes carried his five-year-old daughter Lisa to a hospital in Pisco, Peru, according to Alan Bolus. He showed doctors there that his village's dens were unable to treat a large tumor that was developing in his abdomen. After the examination, doctors found that swelling, in fact, was not actually a tumor. Dr G3rado Lozada was told by Lisa's father that he was having regular courses from the age of three, but they had stopped about 7 1/2 months before the visit. He listened to the young girl's abdomen with a stiscope, and heard a small second heartbeat. An X-ray was also run and then there was no doubt... Astonished by doctors, five-year-old Lisa Medina was about seven months pregnant. She was soon taken to a hospital in Lima that confirmed pregnancy specialists. Lisa's father was arrested on suspicion of incest but released on suspicion of lack of evidence. On Mother's Day in 1939, when Lina was just under 5 years and 8 months old, her baby was delivered by caesarean section. It was a healthy 6-pound little boy, and Gerardo was named after the doctor who had originally diagnosed Lisa's pregnancy, Dr. Grado Lozada. Further investigations into the case were conducted by Dr. Edmundo Skomel, one of Peru's leading doctors-researchers at the time. She discovered that Lisa's menstruation actually started when she was only eight months old, much earlier than her father had originally reported. Skomel also documented the results of an experiment that showed Lisa had the ovaries of a fully mature woman. He concluded that the reason for the early development of his reproductive system must have been from a pituitary hormonal disorder. But Gerardo's father's identity was never identified. For a long time, Gerardo grew up in the Medina family as if he were Lisa's baby brother. Two years after Gerardo was born, American child psychologist Paul Kosack was allowed to speak to Lisa for a while. As stated in the New York Times in 1941, Ms. Kosak said, Lisa is above normal in intelligence, and the baby, who is a boy, is completely normal and physically developed better than the average Syza (Spanish Indian) baby. He thinks of the baby as a baby brother, and so does the others. Family. Lisa Medina's case is often claimed to be a trick, but the story has been repeatedly confirmed by doctors in Peru and in america over the years. Insufficient evidence was gathered that there was little room for doubt, including photos, X-rays, biopsies, and complete documentation by a number of doctors. Gerardo grew up believing that Lisa was her sister until she was 10, when taunts by school-goers led her to discover the truth. In 1972, when he was 33, his younger brother was born... Her mother Lisa was married, and she had a baby with her new husband. Gerardo died of a bone marrow infection seven years later at the age of 40, but Lisa and her husband still live in Peru and their son now lives in Mexico. Read more: Snoops' article about Lisa Medina (warning: Contains a nude medical photo of pregnant child) Alan Bellosis is the founder, designer, and editor of DamnInteresting.com Management, and she is always behind schedule. What happened to Lena Medina? He's still alive and where is he? Does that question bother everyone? According to Reuters documents in 2007, he lived in Lima, Peru, after another boy at 72 (the second son now lives in Mexico City, Mexico). Her first child, Jerado, died of bone cancer at the age of 40. He avoids the media as much as possible. Medina Lisa after giving birth to Medina Lia in hospital 28 years later Lisa Medina Medina with her son Lia Medina with her cute baby (sorry Anne Lisa it's Hilda Trujillo, the third youngest mother) thanks to Courtney Lea Butzko LINA-MEDINA with her son and doll who is Lia Medina? Medina Lisa was born on September 27, 1933 (Powerange, Peru, Little Andes Village), and she is known as the youngest confirmed mother in history. Lisa was just as normal as any other girl of her age. But at the age of 5, her parents realized that her stomach suddenly increased in size and her body had matured enough. As modern medical facilities were not available there they just waited to hope that everything would take place right after a few days. But they eventually concluded that Lisa had a tumor in her abdomen and carried her to The Peruvian Pisco City Hospital. Preliminary research, revealed that she is pregnant for 7 months and doctors confused how this 5-year-old baby can conceive? To confirm the pregnancy, doctors took urine X-rays, and the study tested other hormones. Lisa's father also said she had regular periods before her abdomen started to swell, which suddenly stopped. Pisco doctors were stunned by Lisa's pregnancy and will not pass the opportunity to study this so-called medical miracle. Dr. Gerardo Lozada took him to a hospital in Lima Peru to be viewed at all times. After arriving at that hospital, doctors decided to give birth to a caesarean section because her pelvis did not have enough space to deliver the baby. When he was. 5 years 7 months and 21 days (May 14, 1939) a six-pound boy was born in good health. He gave her gerardo's name after her doctor, Gerardo's infant father was never identified. In fact, his father was jailed for incest and sexual assault, but was sidelined due to lack of evidence. Jena has never given herself answers to doctors about how she was impregnated. When Lisa given birth, she and her family believed the case was over. However, doctors wanted to continue identifying and studying Lisa's medical miracle. A new doctor and researcher named Dr. Edmundo Skomel began her research on her pregnancy, and she concluded that her case was not a trick (some people at the time believe it was a rumor) and her findings shook the medical world. She discovered that Lisa had regular courses from the age of 8, much earlier than Lisa's father told doctors. She confirmed through testing that the ovaries were fully developed and that Lisa's body had matured from a hormonal disorder. All of Dr. Skomel's discoveries were later documented and used by other doctors. But Lisa's family refused to let their daughter or granddaughter spend their lives in hospitals and research centers. When the baby was a few months old, Gerardo and Lisa went home. The family decided to grow Gerardo as Lisa's younger brother. But when the child was 10 years old, Gerado realized that Lisa was her real mother. Surprisingly, the Medina family continued their normal lives. When Gerardo was 33, Lisa had given birth to his younger brother. She was already married at the time. However, just seven years later, Gerardo died of a bone marrow infection at the age of 40 in 1979. Today, Lisa still lives with her husband, Raul Juradou, in a poor neighborhood of Lima, Peru (a region known as Little Chicago). Their surviving son lives in Mexico. In 2002, Lisa's name barely scratched the level of media attention again, which she refused to do an interview with Reuters.
