Kenmore elite gas dryer f1 error code

E1 can only display an open thermister that shouldn't be as expensive to repair, but since you haven't posted the "model number" of the machine (from its model and serial number tag), we can't say whether this option is applicable to your particular Kenmore Elite dryer or not. Dan O. www.Appliance411.com/?ref411=Kenmore+Dryer The appliance information page = D model number is 110 84832200. Thank you. E1 on this model dryer displays an open thermistor (solid state temperature sensor) which, as you can see below, is not as expensive for a part - Kenmore 110.84832200 Thermister LINK &t; O. www.Appliance411.com/?ref411=Kenmore+Dryer The appliance information page = D error code is actually E1, not F1. If it was just a typo and it needs open thermistor to be changed, do you think I could do it myself? Are there manuals or instructions to replace it? Thank you for the information. Yes, it was a typo and will be corrected as soon as my editing goes through. I have no idea about your skills, but I would think it would usually be a job that the most reasonable handy homeowners could do. There is no service manual for exactly the model of the AFAIK dryer, but there is one for Whirlpool duet dryer, which is their equivalent to the Kenmore HE3. This manual can be viewed at the following link:LINK &t; is the one for Whirlpool's washing machine in case you are ever interested:LINK &t; O. www.Appliance411.com/?ref411=Kenmore+Washer The appliance information page = D. I have a Kenmore Elite dryer model with the number 110.72052100 and I get the E1 code, but not all the time, because this model number also means that I have to replace the thermistor. All information is highly appreciated. Thanks to Brad San Diego ** for this model number, this error code also means that I need to replace the thermistor. **Error and error codes are not an absolute indicator of the failure of a part, but only a pointer to a "possible" cause. While E1 displays the control "thinks" on your model, the thermistor circuit is open, the real problem could be the thermistor, the wiring to it or in the thermistor capture part of the electronic control. The control has no way of knowing what is the case. You could just replace it and hope for the best. They are not as expensive and they are often the root cause of such error messages rather than the other possibilities. - Kenmore 110.72052100 Thermister LINK &t; O. The Appliance Information Site =D ' I just replaced my thermistor, thanks to your information. It was very simple. I'm not that great with device repair, so if I can do it, anyone can. I had the help of a neighbor, and it made a bit easier, but I think it could be done pretty easily by one person. A few tips: 1. While there was no repair manual listed as available when I removed the back panel and the top plate of the dryer, I found that there was a manual in a plastic holder on the inside of the dryer box! It had all the information you need to do this repair, and even gives test processes. Maybe I was just lucky, but it's worth half an hour to check the back panel and the top panel. 2. To get to the part, remove the front kick plate. 4. Once the kick plate is turned off, there is an elongated plate that needs to be removed. It's right in front: the first thing you see. 5. Once you have turned off this plate, thermistor and the thermal fuse are right there. It is a little tight in it, and a small ratchet is necessary to remove the screws easily. I went ahead and replaced the thermal fuse while I was there. I found the parts in my local **** parts and service center. The thermistor was 18 dollars, and the thermal fuse 12.This fixed the problems I had (dryer would stop and display the E1 error code). Good luck! Steve ** I pulled the back panel and the top plate of the dryer, I found that there was a manual in a plastic holder on the inside of the dryer box! **Most electronically controlled devices have a mini manual or a tech sheet with the wiring diagram of the device. On dryers, which is most common in the console panel, but it could also stick to the side of the cabinet in the dryer or behind an access panel.** there is no repair manual listed as available **While not for the specific model, the repair manual on the following link covers most whirlpool and whirlpool built Kenmore dryers (with model numbers from 110... except Duet and HE3 models), although the technology of the device may still need to be consulted. It should cover basic disassembly and common mechanical components. - Whirlpool/Kenmore Gas/Electric Dryer Repair Manual LINK &t; I just replaced my thermistor... This fixed the problems I had **Glad to hear it, thanks for the detailed tracking. Dan O. www.Appliance411.com/?ref411=Kenmore+Dryer The appliance information site = D- Initial Symptoms: My dryer showed the E1 error intermittently during execution, but disconnecting the device for a few minutes was got rid of the error. This was an acceptable bypass, but lately the temperature just wasn't hot enough so the clothes don't dry. What I did: Thanks to the great tips I have Thread, I thought this is probably the thermistor. After the repair parts list (supplied with product manual) I know that I need a 3976615, which I know how to order. But I decided to dismantle the unit first to make sure the service job was manageable (yes, it's actually very simple). My current problem: Start-up lower front cover, I discovered a lot of lint! I also took the Lint Duct Assembly and Blower Cover and wow there were more lint and the presence of fine white powder (like accumulated detergent paste) I dusted everything off (including the thermistor) and believe that this might fix my E1 problem without actually having to replace the thermistor. My question: I discovered that my periscoping vent had collapsed, limiting airflow. My belly tells me that this is the reason why there were lint everywhere. Can anyone confirm that fussel should NOT normally accumulate inside the device? I also wonder now if I should disassemble the blower ad to clean the case, which still has a lot of the white powder that can't suck out because of the wheel clogging. If I have to do this, does anyone know how to remove this wheel? Are there other maintenance work I should do - as on the drum - because I know that I have had an exhaust gas problem for a year? I will publish my results as soon as I have cleaned and reassembled everything. Thank you Flash ** Can anyone confirm that Fussel should not normally accumulate inside the device? **It's not designed, but can build up depending on conditions.** I also wonder now if I should disassemble the blower ad to clean the case **Ensuring that all internal channels are clear, is a good idea was good as the blowerad.** does anyone know how to remove this wheel? **With most Whirlpool/Kenmore dryers, the blower ad is screwed onto the motor shaft with a left thread. but if you post the correct model number of your dryer (HE3 is not), we can check this. However, I would suggest that you DO NOT try to remove the blow fan from the engine if you do not necessarily need to. They can be difficult to remove and can break. Sometimes they have to be broken to get rid of them!** Are there any other maintenance work I should do - like on the drum - knowing that I have had an exhaust gas problem for a year? **Apart from cleaning the lint and fixing the vent, it should not... unless there are additional symptoms or problems. You can read a little about the correct dryer vent ingested at the following link:- How long can my dryer be ventilated? LINK &t; O. www.Appliance411.com/?ref411=Kenmore+Dryer The appliance information page =D. Just this forum googling for the E1 code on my whirlpool duet. Thank you for the info! As mentioned earlier, you should use a service tech manual in the Have. Simply pop the top by inserting the 3 screws along the rear edge.Or... Save the effort and grab the scanned copy of my :) just bought the Thermistor from a local place (24 USD), and expect that to fix. -Wayne Dan,Would my model number also be a likely candidate for Thermistor replacement an E1 error code? Thank you! ** Model number 110.92822100 Dryer HE3 -- Would my model number also be a likely candidate for thermistor replacement in the face of an E1 error code? **Yes, an E1 error code on this model also displays an open thermistor.- Kenmore 110.92822100 Thermistor LINK &t; it is the most likely cause, there are the other options I specified before that could also cause it, although they are much, much less common. JMODan o. www.Appliance411.com/parts/?ref411=Kenmore+Dryer The appliance information page = D. I have described the same problem as in the post of flashskyni. After its correction by cleaning/emptying all lint, dust and the accumulation of fine paste and white powder cake in the Lint Duct Assembly and blower. I also removed and wiped the thermistor to clean the surface to remove all the white powder deposit. The dryer worked perfectly after cleaning. Thank you for this contribution. I didn't want to replace the thermistor until I was sure that this was the cause. It seemed that this cleaning of the blower secretion and wiping the surface of the thermistor corrected the error. Note that the white paste/powder deposit is the result of the bounce dryer plates/softeners. So you need to be aware of the repeated use of bounce plates and poor ventilation could cause the E1 error. To prevent this problem from happening, you should always clean the vent and perform the complete cleaning from the Lint Duct Assembly and thermistor. If necessary, replace the thermistor, but this part should be very durable as it is stationary and only acts as a sensor by reading a certain amount of hot air over the detection surface. For an image of the thermistor and its capture area, you can visit a website called repairclinic.com and article nr. 1181075, which is the spare part for the original thermistor part No. 3976615. We have started to get the same error on a model No. 110 92826101. Would this also be a thermistor indication? Thank you! --Mike An E1 message indicates a problem with the sensor circuit. Whether it is the sensor itself or not would have to be determined. JMODan o. www.Appliance411.com/parts/?ref411=Kenmore+Dryer The appliance information page = D. Any idea how to get to the thermistor? If you have actually read the previous posts, you will see the part in the closet via a service manual. It's a good thing to have. But short answer -- take the kick panel under the door and it's right there. My dryer only works for 10 - 15 minutes on automatic cycle. There has never been an error code, it's just about drying, cooling down then shutting down. It has worked on the manual cycle, but takes a long time to dry. I just bought a new vent hose because the old fussel had built up. I have the Owners Manual and Book and the repair parts list book with model number 110.828.22101. The parts list book gives me a disassembly of the dryer. Of what I found on blogs and the like, could it be the thermistor? ** My dryer only works for 10 - 15 minutes on the automatic cycle then turns off. There has never been an error code **Did you turn on the signal? For some models, a problem can be signaled by the end of the cycle signal instead of displaying an error code. If you turned off this signal, you would miss such a message.** I just bought a new vent hose because the old one had a slightly built-up lint. **You have replaced the vent from the dryer directly to the outside or only from the dryer to the wall? If someone should just look at the wall, how to clean the "whole vent length" (see following link). Do NOT put off such a cleaning as it could pose a fire hazard!- How long can my dryer vent be? LINK &t; www.appliance411.com/links/jump.cgi?ID=778JFYIDan O. www.Appliance411.com/parts/?ref411=Kenmore+Dryer The appliance information site = D. I have the same problem as the first post, an E-1 error code and a short drying time, about 10-15 min. Model No. 110.82826102 Is the correction the same as the first post? Close in model number, but I thought I would ask. Apparently simple enough, great explanations and answers. Thanks ** model - is 110.82826102 E-1 error code. Is the correction the same as the first post? **E1 on this model dryer also shows an open thermistor, yes. - Kenmore 110.82826102 Thermistor LINK &t; www.appliance411.com/data.php?ap=8577274JFYIDan O. www.Appliance411.com/?ref411=Kenmore+Dryer The Appliance Information Site =D' My model number is 110.82832100. Is the correction the same as the first post? Thanks for the help, I struggled with the same code. When I pulled out the dryer, I found the vent pipe with the first elbow facing down, then turned upwards, firm, with flex tube. Then 3 feet to the exit with another elbow. I think this has caused too much restriction of airflow. Like a drain trap in sanitary facilities. Crazy, no? I have the E1 error and have replaced the thermistor and still have the same error code. please can advise what if another electrical wiring could cause this problem. Thank you for your contribution. We followed the instructions, bought the thermal fuse and replaced it. Now our dryer works again. Hello everyone just wanted to add to the comments I worked on this dryer today and had the 1e error, which I found that this was one of the auf dem Board fiel aus, wie, sobald ich es wieder alles war ok DRYER STARTS RUNNING DISPLAYS 40 MINUTES ON TIMER WITHIN 1 MINUTE IT JUST STOPS SPINNING UND WONT START UP UP UP FOR A FEW MINUTES NOT SURE WHAT TO REPLACE. I WOULDNT THINK ITS OVER HEATING CAUSE IT DOESNT EVEN HAVE TIME TO HEAT UP. oben. oben.
