## Rory storm and the hurricanes songs

Photo: FlickrThere are a growing number of companies in coastal areas where storm windows are sold and installed. Since not all shutters are similar, it is important that the product best meets your needs - and it is just as important to be sure that your shutters are installed correctly. Here are some tips to help guide you.

- Storm hatches offer two types of protection: They can be designed to protect against wind pressure, debris shocks or both. It's important to know what protection you're going to get.
- If the shutter is designed to withstand the debris effect, look for Dade County, FL, standard. This is a very harsh standard for advanced extreme wind conditions found in South Florida. It is also appropriate to use barrier islands elsewhere on the south-east and gulf coasts, other highly endangered places or places with particularly high air waste potential. Shutters designed to a lower standard may be sufficient for these high-risk locations and be a more cost-effective alternative.
- Shutters must be attached to the structure frame of the house and window or door frames. Window and door frames may themselves be insufficiently attached to the structural frame to withstand extreme pressure caused by strong winds.
- Make sure that all exposed metal fittings (including screws, built-in anchors, etc.) are weather-resistant and corrosion-resistant.
- Design and installation instructions for carbstic hatches are available. These shutters offer some level of protection and are usually the cheapest. However, they often require a lot of time to install, and the process can be difficult and even dangerous. Plywood windows are heavy, apparently need at least two people to install, and the upper loo windows require a ladder. Even moderate winds exacerbate the risk of working on a ladder with heavy plywood. For these reasons, plywood storm hatches are best suited to lower floor windows.
- Homeowners garages, especially attached garages, should also ask their shutter dealer about modernizing their garage doors with high winds. If the garage door fails due to high winds, it can cause the interior of the house to become pressurized and increase the chances of losing all or part of the roof. While correctly selected and installed shutters should add to the performance of the home with high winds, it is important to remember that nothing is hurricane resistant. Keep in mind also that each home is unique and there are no general recommendations that are generally applicable to all homes. For more detailed advice on threat modernisation recommendations for existing homes or threat mitigation techniques for new homes, homeowners are being urged to contact licensed, in consultation with an engineer in their area. These tips were developed by SC Sea Grant Program consulting faculty at Clemson University's civil engineering department's wind load test facility.

Hurricane is an exciting remake of the classic arcade game Cyclone. In this game we have placed 16 LEDs around the circle of LED closest to you in a different color than everyone else. The main goal of this game is to collect as many tickets as possible for each round that you play. At the beginning of the round, the coin is pressed and ends when you press the stop button. If you are actually in the ring you must try to stop the light as close to the clear LEDs as possible. The closer you get to clear the LED the more tickets you get! And actually stopping the light to clear the LED results with a huge 8 ticket bonus! Now around this time you can ask how you can track the number of tickets that you have received. After all, how are you going to know what kind of prizes you'll get if you don't know how many tickets you've earned. Well, you can see the number of tickets you have in the seven segment display nexys board. And at the end of each round of the game automatically add a number of tickets you just got your previous tally. So all the time you play you know exactly how many tickets you have! This game, while simple, is a good way to introduce yourself to basic hardware, wiring and ISE design suite. This project is ideal for any beginner who wants to gain experience by making basic games to build their skills or show off to friends. All these aspects of making the game are covered in a separate step, so that you can collect the necessary tools at each of your own paces. To build hardware hurricane you need some components:

Hardware parts:1 8 inch wooden disc1 dremel, exacto knife, or otherwise cut wood1 1/8 inch drill or otherwise punch holes in LEDs

Wiring/electronic parts:1 nexys board1 breadboard16 LED16 hardboard 33 jumper cables

Lective components: SolderElectrical tape if you want to isolate things

Software parts: computer ISE Design Suite

You can collect parts separately each step, or all at once. It's up to you, no matter what pace you really want to be. When you get all your components you have to make the game it is time to prepare the actual wooden board that the game will be played. We chose to use an 8 inch disc on the board but the size is really about you. The first step is to cut the opening, where you expect to place seven segment screen and buttons, so you can see the score and have easy access to all controls. The next we had to do was cut the hole in the bottom, the center of the disc, so that you would have access to seven segments of the screen and buttons that control the game. It doesn't matter how big the opening is, all that matters is that you see the screen and tap cut along the orange dotted line. And then you can drill holes around the outside of the disc where you expect to put your LEDs. This step is quite difficult just because it's hard to get right, so just be careful about that. Once you have completed this last step of drilling holes in led's you should be ready to prepare your disk and have ready to wire your board! Connecting led's is done in 5 pretty simple steps:

Step 1: Watering your 100 ohm resistor positive or long lead LED. Note: If you don't have access to watering iron or don't want to burn yourself, you could probably twist the leads together and have things work just fine. Electric tape would help in this case.

Step 2: Watering the wire with both negative lead and resistor that you just solder led.

Step 3: Take the wire solder resistor (positive) and connect it to the correct pin that you set your hardware description step 4: Then take the wire solder short lead (negative) and connect it to your underground column breadboard.

Step 5: Attach the LED to the disc so that they stay in place, we used glue. Another thing you need to do to ensure your hardware runs is to run a wire set ground pin board on your desk in your underground column on your breadboard. Once you have completed these steps, you are perfectly ready to apply your code onto your nexys board. The Nexys 2 board, which is common to many hobbyists, uses ise Design Suite. If you want to change the code, you need a complete set. We arbitrarily added our project file, called cyclone seconds. When you open it in the ISE design set, you can change everything you want to add or change its capabilities. If you don't care about changing it, go to the last paragraph. Our file called clockdiv determines how fast or hard the game is. If you want to change the clock speed, search for the word constant in the code. Then change the number on the same line to be larger if you want it to be easier or smaller if you want it to be harder. If you just want to use software as is, you can easily upload an attached .bit file, which should work well if you followed the steps in pinouts correctly. After upload the code, your game should be ready to play! At this point, the game should work! To play, there are only 3 buttons you need to use: Button 1 stops the light and rewards you with how many tickets for light are worth. Button 2 triggers light moves around as if you have entered a coin. Button 3 (optional) is a cheat button, and if you hold it by pressing button 1 you will always get 4 tickets. Button 4 will restore the number of your tickets as if you had cashed in your tickets. Have fun, let's hope you enjoyed doing it as much as we did!

The Terra satellite captured this image of storm Dorian as it became a hurricane near St. Thomas on August 28 at 1:30 pm ET. (Picture: © NASA Worldview, Earth Observation System Data and Information System (EOSDIS))

Tropical Storm Dorian gathered strength and turned into a hurricane this afternoon near the island of St. Thomas in the U.S. Virgin Islands, according to the National Hurricane Center (NHC). The storm is currently moving northwest at 13 mph (21 km/h) over the U.S. Virgin Islands. It should continue in that direction over the next few days, moving across the Atlantic southeast of the Bahamas and perhaps hitting Florida.

Dorian sustained wind speeds of 82 mph (132 km/h) making it a Category 1 hurricane. (Category 1 hurricanes are at a wind speed of 74 to 95 mph or 119 to 153 km/h.)

A hurricane warning are currently in effect for Vieques and Culebra in Puerto Rico as well as the U.S. and British Virgin Islands. Meteorologists expect the storm to strengthen further until March 3. (Image credit: NOAA)

All signs are that this Labor Day weekend of a powerful hurricane is near Florida or the southeastern coast of the United States, the NHC wrote in a public advisory. While it's not yet certain that the storm will hit the U.S. at all, the NHC recommends that residents be prepared when it does. The risk of dangerous storm surge and hurricane-force winds is growing in the central and northwestern Bahamas and along Florida's east coast, though it's too early to determine where those threats occur, NHC officials wrote in a public advisory. Residents in these areas should ensure that they have a hurricane plan in place and not focus on the exact forecast of the Dorian Center. The storm is likely to bring heavy rainfall with the potential to produce flash flooding over the next few days across parts of Puerto Rico and the U.S. and British Virgin Islands, according to public advice. Heavy rain will also hit the Bahamas, Florida and southeastern U.S. later this week and early next week. Originally published as Live Science. Research.
