## 105cm to inch

Our editors independently research, test and make advice on the best products; You can learn more about our review process here. We may receive fees for purchases made from our selected links. The final sony X800G verdict is one of the best 48-inch models available now. With 4K resolution and HDR10 support, you'll get stunning images time after time. The voice-enabled remote gives you access to Google Assistant or Alexa without a smart speaker, and with Chromecast, you can mirror your Android mobile device for more ways to share videos. Samsung Q80T is another great choice for a 4K TV. Samsung has started to include their Bixby virtual assistant on all their new TVs so you don't have to set up an Amazon or Google account to get voice controls. It also features a dual LED panel for better color range and object tracking sound for a more immersive listening experience. Taylor Clemons has been reviewing and writing about electronics for more than three years. She also worked in e-commerce product management, so she has the knowledge of making solid TV for home entertainment. Melanie Finola spent five years writing for Lifewire about offices from Telecom and Mobile, she has more than a decade of work experience as an IT manager and artistic director. Robert Silva has been reporting on electronics since 1998. It focuses more on home entertainment and home theater technology since 2000. He appeared in the YouTube series Cinematic Nerds. Enter the TV section of any big box retailer and you may be led to believe that even a 55-inch TV is on the small side, but despite the push towards bigger and bigger screens, not everyone needs or wants a massive TV, and there is still a strong market for sets in the 48-inch range. In fact, if you live in a smaller house, apartment, or apartment, 48 inches can only be the sweet spot for your living space and your entertainment needs, and best of all you can get some pretty sweet 48-inch sets with amazing features and image quality at prices that won't damage your wallet, leaving you with plenty of accessory space by adding things like a closet or a better sound system. One of the best things about TVs of this size is that you have a lot of options, meaning you almost certainly find something that will suit your needs and your budget, but of course many options it can make things a little confusing, so it's important to first consider what you want out of TV and then narrow things down from there. Do you plan to use it for casual viewing of daytime news and TV? Primetime hits? Blockbuster movies? Is it going to be put in a darker basement or a brightly lit family room? Are you going to stream from the services like Netflix or just rely on broadcasts over the air? These are all the kind of questions that are important to think about. Shopping for a 48-inch TV. Amazon you're surely aware that 4K TVs are all the rage these days, and while we certainly don't discourage anyone from buying one if you have the money to spend, when dealing with smaller screens it's really important to ask yourself if you're going to be able to really take advantage of the higher resolution, both in terms of where you put it and what you'll be watching for it. You see, if you're usually sitting more than a certain distance from the screen, chances are your eyes won't be able to estimate the additional details offered by the UHD 4K set. While this will vary depending on the quality of your vision, if the design of your room means you will be sitting much further away from it, then you might want to consider saving a few dollars and just getting a 1080p HD set instead, where you will still be able to fully enjoy almost double that distance. However, it's important to remember that there are more UHD 4K TVs than just the actual resolution. Almost all modern 4K kits also offer high dynamic range (HDR), which is something you won't find in 1080p HD. There are different HDR flavours, such as Dolby Vision, HDR10 and others, but they all have one thing in common, providing much richer colours and deeper contrast levels. Simply put, you get a picture much closer to the one the real world looks like. However, to take advantage of this, you need to encode the content you're watching in HDR format in the first place, and if all you plan to use the TV for is watching things like news, sports, daytime TV shows, chances are you won't see HDR content anyway. In fact, if all you do is connect your TV to cable or an antenna in the air, you probably won't even get much 4K content at all. HDR formats are generally used most in feature films, although many modern primetime shows also offer HDR, especially when they come from streaming networking like Netflix, and even more so when they're original and produced by these streaming services. Keep in mind, however, that your set must also support the specific HDR format in which the content is broadcast. Although many TVs support more than one HDR, not all of them support them, so you'll want to read the sea print. As a rule, dolby vision kits typically offer the widest range of support in other formats as well. Samsung Q7F Series Flat QLED Ultra HD TV Example. Photo Courtesy of Amazon as we specialized earlier, the 48-inch size range has a lot of different options available, and while the cheapest models still only sport standard LCD screens, if you're willing to spend a little more you can off By going with even better screen technology. If feature films are your thing, we generally recommend going with an OLED screen if you can afford it, as this will provide the best contrast ratios you can get, with very deep blacks making it a particularly great choice for action/adventure films. Similar to the plasma TV technology that came before it (which home theater enthusiasts have sworn by for years), OLED screens actually shut down completely in areas that should be black, unlike LED/LCD TVs which can only dampen them dark gray. OLED screens also let you watch them from any angle without changing the odd color you see when viewing LCD/LED from the side. However, if movies aren't your main thing, or a simple OLED screen isn't in your budget, then an LCD/LED system can still be a great choice, and in fact even might be better if you plan to set up your TV in a brighter room and watch it in the daytime. Samsung's QLED technology is part of the best LED ideology available, as the company is building it to compete with OLED, and while it can't provide the same contrast ratios, it's getting much brighter and still provides the same kind of deep, rich color duplication that's particularly great for HDR content. LG's Nano Cell LED technology is also a solid choice if you can't afford to board one of its largest OLED systems. Nowadays most TVs offer a pretty impressive built-in sound. These aren't last year's single-channel speakers or two channels, and many of them can actually produce respectable virtual surround sound only from the built-in speakers. Of course, it won't actually compare to setting up a real 5.1 channel Dolby surround system in your play room, but it's probably more than enough for casual TV viewings. Few things besides truly encoded movies with impressive 5.1-channel sound, and the sound quality of modern TVs should easily meet the task of handling such content. On the other hand, however, if you're a fan of action movies you're probably going to want a better sound than any group you can deliver on its own, so you need to make sure that the TV you're considering has the features needed to support a real surround sound system. In most cases, this means digital optical audio output or hdmi audio return channel (ARC) connection, although some newer and newer models also offer support for wireless speaker system standards like WISA, allowing you to add 5.1-channel audio without the need for cable or a standalone home theater receiver. These days it's hard to find a modern TV that doesn't include smart TV features with support for popular streaming services like Netflix, Hulu and Amazon Prime are well understood, so even if you have your own standalone digital allowed or don't want streaming, you'll get Features anyway, but the good news is that in most cases they are quite intrusive if all you want your TV to do is work as a display for other devices. Still, if you definitely don't need the built-in smart TV features, one of the great things about smaller sets is that you can still find dumb TVs that are really just screens, so you can save yourself a few dollars if you're willing to plug in your own Roku, Apple TV, or Amazon Fire TV converter, which can also offer some advantages for having your smart TV features built in, depending on what it is you plan to do. TCL S405 Series 4K Ultra HD Roku Smart TV Example. Image provided by Amazon still, the built-in smart features are getting better and stronger, and many now include integration with voice assistants like Amazon Alexa and home automation systems like Apple's HomeKit. Usually it just comes down to choosing the platform you prefer and which streaming services you plan to watch. However, if you look at a TV that supports Amazon Alexa or Google Assistant, just be aware that in most cases that doesn't mean they include the built-in actual voice assistant, but rather that they can be triggered by commands that you're talking about amazon echo or a Google Home speaker that's already on the same network. Keep in mind that if you plan to stream content over the Internet, you'll need an Internet connection and a Wi-Fi router that can handle it, which is even more true if you're looking at a 4K UHD set; Streaming Netflix in 4K requires a minimum connection of 25Mbps, and will eat up to 10-12GB of data per hour, so you'll want to be wary of all data caps as well. In addition, if you keep your TV away from where your Internet connection is coming from, you may need a long-range router or Wi-Fi to ensure you can get a signal strong and fast enough for your set. If you buy a 48-inch TV from a large brand like Samsung, LG or Sony, your choice will be determined more often by the smart TV features you're looking for or the type of screen technology you want, as each manufacturer can be quite unique in these areas. For example, while you may find it rather ironic given their competing smartphone platforms, Samsung TVs are actually one of the best options for Apple fans, thanks to their built-in support for Apple's TV+ service, iTunes movies and TV, and AirPlay 2 streaming. On the other hand, Android enthusiasts may lean more towards brands like Sony that use the Android TV operating system. LG B6P Series 4K Ultra HD OLED TV. An image provided by LG Electronics in a similar way, if you're looking for an OLED screen, LG does as many of the best you can find, while Samsung's QLED technology leads the way between LCD/LED panels. However, you shouldn't be rocked by the big brands if you're on Or you're looking for a more casual viewing set, which is even more true if you just want dumb TV to watch cable OR broadcast TV. Going off-brand can save you quite a bit of money, and you may be surprised by some providers like TCL because you've probably never heard yet offer great TVs with advanced smart TV and connectivity features. Features.
