That original looklike TI-Nspire is developing out TI PLT SHH1 prototype calculator (which itself is derived from the Casio ClassPad 300), the TI-92 series of calculators released in 1995, and TI-89 series calculators released in 1998. [1] The TI-Nspire features a non-QWERTY keyboard and another key-by-key layout compared to its predecessors. The TI-Nspire enables users to exchange the existing removable keyboard with a functional copy of the TI-84 Plus series keyboard. The TI-Nspire series I/O has a connection for the TI-Nspire Lab Cradle, another that serves as a connector to TI's wireless network adapter, and a Mini-USB connection for the transfer of data. The TI-Nspire series is available with and without a computer edi-bra system. In 2011, Texas Instruments released the CX line of their TI-Nspire calculators that effectively replaced the previous generation. The updates included improvements to the original keyboard layout, an addition of a rechargeable lithium-ion battery, 3D chart capabilities and reduced form factor. [2] TI has gott rid of the removable keyboard with this generation and therefore the TI-84 compatibility mode is. In 2019, the TI-Nspire CX II was added and featured a boost in clock speed and improvements to the existing operating system. Versions The TI-Nspire series uses another operating system compared to Texas Instruments' other calculators. The TI-Nspire includes a file manager that lets users create and edit documents. Due to being developed from PDA-esque devices, the TI-Nspire retains many of the same functional similarities with a computer. TI-Nspire The standard TI-Nspire calculator is comparable to the TI-84 Plus in functions and functionality. It features a TI-84 mode by way of a replaceable snap-in keyboard and contains a TI-84 Plus emulator. The probable target of this is secondary schools currently using the TI-84 Plus or has textbooks covering the TI-83 (Plus) and TI-84 Plus lines, and allowing them to switch to the TI-Nspire line more easily. The TI-Nspire started developing in 2004. [quote required] It uses a own SoC of the ARM9 variant for its CP. The TI-Nspire and TI-Nspire CAS (Computer Calm System) calculators have 32 MB NAND Flash, 32 MB SDRAM, and 512 KB of Flash. [3] However only 20 MB and 16 MB are user-accessible respectively[4] The TI-Nspire released into two models; a numerical and CAS version. The numeric is similar in features to the TI-84, except with a larger and higher resolution screen and a full keyboard. The function that lacks the numerical is the ability to solve algebraic equations such as indetermined integrals and derivatives. To fill in the gap to require an algebraic calculator, Texas Instruments introduced the second model called TI-Nspire CAS. The CAS is designed for college and university students, giving them the characteristic of calculating many algebraic such as the Travel 200 and TI-89 (which the TI-Nspire is meant to replace). However, the TI-Nspire does not have a part of the ability to program and install additional installation that the previous models had, although a limited version of TI-BASIC is supported, along with Lua in later versions. C and the congregation are only possible by Ndless. Because the TI-Nspire does not have a QWERTY keyboard, it is acceptable for use on the PSAT, SAT,[5] SAT II, ACT,[6] AP and IB Exams. The TI-Nspire CAS calculator is able to display and evaluate values symbolically, not just as floating points numbers. These include algebraic functions such as a symbolic differential equation solution: deSolve (...), the complex eigenvectors of a matrix: eigVc (...), as well as calculus-based functions, including limits, derivatives and integrals. For this reason, the TI-Nspire CAS is more comparable to the TI-89 Titanium and Travel 200 than to other calculators. Unlike the TI-Nspire, it is not compatible with the snap-in TI-84 Plus keyboard. It is accepted in the SAT and AP exams (without a QWERTY keyboard) but not in the ACT,[6] IB or British GCSE and A level. The body color is grey. TI-Nspire Touchpad TI-Nspire EZ-Spot. Intended to reduce theft in schools. On March 8, 2010, Texas Instruments announced new models of the TI-Nspire Touchpad and TI-Nspire CAS Touchpad tomb calculators. In the United States, the new calculator was listed on the TI website as a supplement to the TI-Nspire with Clickpad, although it was introduced as a sequel to the previous model in other countries. The calculators were released along with the OS 2.0 update, which contains a number of updates to the user interface and new features. The keyboards on the touchpad keyboards have another and less crowded key layout along with the touchpad, used for navigation. The touchpad keyboards are also compatible with older calculators running OS 2.0 or newer. The new calculators shipping with touchpad keyboards supported an optional rechargeable battery. The second generation is also available in two models, the TI-Nspire Touchpad and TI-Nspire CAS Touchpad, and each model has maintained the color of itself, with the normal one white and black while the CAS is black and gray. To reduce the theft of school-owned TI-Nspire calculators, Texas Instruments also introduced the EZ-Spot Teacher Packs with a bright, easy-to-place, school bus yellow frame and slide case. The hardware of both versions is the same, with the only differences containing cosmetic. The TI-Nspire calculators released after the touchpad TI-Nspires also have EZ-Spot versions. TI-Nspire CX and TI-Nspire CX CAS In 2011, the TI-Nspire CX and CX CAS were announced as updates to TI-Nspire series. They designed a thinner with a thickness of 1.57 cm (nearly half the TI-89), a 1200 mAh (1060mAh before 2013) rechar gesture battery (wall adapter is included in the retail package), a 320 by 240 pixel full color waste screen (3.2 diagonal), and OS 3.0 which includes features as 3D chart. [7] The CX series was released at the same time frame as the Casio Prizm (fx-CG10/20),[8] Casio's color screen that charts calculator with similar features. The TI-Nspire CX series differs from all previous TI graphic cell models in that the CX series is the first to use a rechargeable 1060 mAh Lithium-ion battery (upgraded to 1200 mAh in 2013 res.). The device is charged via a USB cable. TI claims that the battery requires four hours to charge, that a full charge may drive the device for up to two weeks under normal daily use, and that the battery must last up to 3 years before it requires replacement. The battery is user replaceable. [7] With the exception of exchangeable TI-84 keyboards, the CX series retains all features of the previous TI-Nspire models. The colors of the calculator are still the same as those of the TI-Nspire models; The CX is white and dark blue, while the CX CAS is grey and black. The external compounds have changed slightly. The mini-USB port, located at the centre on the middle of the TI-Nspire series, has moved to the top right of the CX series. On the CX series, TI immediately added a second port to the left of the mini-USB port for a new wireless module. The new wireless TI-Nspire Navigator adapter, which allows teachers to monitor and send students, is not compatible with previous TI-Nspire models. The third port, located at the bottom of the handheld, is for the TI Charging Dock and Lab Cradle. The keyboard layout is very similar to that of the TI-Nspire Touchpad. Both models have 100 MG of user memory and 64 MB of RAM. The retail package comes in a plastic blister case and does not have the full manual, while the teachers edition comes into a box with a TI-Nspire CX poster for classrooms and the full manual (in English and French in the US). Both devices ship with the student/teacher software for Windows/Mac OS X. According to Texas Instruments, the CX in SAT, IB, AP, ACT and British GCSE and A-level exams are accepted. The CX CAS is only accepted on SAT and AP. Chinese Versions Four models aimed at launching the Chinese market, with specialized features. All four models have Chinese marked keyboards. The CX-C and CX-C CAS models are similar to CX and CX CAS, but have included a concise Chinese dictionary. The CM-C and CM-C CAS are cheaper, have a more currently fed design, but has only 32MB of RAM and no port for the wireless module. [9] The systems of Chinese versions were not removable with those of the international models. TI-Nspire CX II and TI-Nspire CX II CAS In 2019, Texas Instruments introduced the TI-Nspire CX II and TI-Nspire CX II CAS. [10] They have a slightly different operating system with various reinforcements and slightly improved hardware, including python integration. versions such as China, the continent of Europe also aimed for its side's These calculators include a -T to the CX. The CX II-T and CX II-T CAS both have different body color designs as their North American counterparts. One of the main feature differences in European versions is the inclusion of an exact math engine in the non-CAS version. European models also leave the WiFi adapter port from on top of the calculator. TI-Nspire Software Texas Tools offers several different versions of software for their calculators. They offer CAS and non-CAS versions of their student and teacher software. This software allows users to share results with classmates and teachers and gives the user a nulated version of the TI-Nspire. TI also provides a computer switching software for connecting their handheld to transfer their computer documents. The software allows for the synchronization of documents to and from the calculator and/or computer. This software requires a license to be used. Programming languages besides the TI Basic functionality, the Nspire calculators offer functionality to perform scripts written in two additional programming languages with the standard TI Firmware. With the release of OS 3.0, the Lua scripting language is supported, so that 3rd party programs can be performed without the need for exploits. [12] There are currently more than 100 third-party programmes and features for the Nspire that introduce new functionality, such as Laplace Transform, Fourier Transform and 3th and 4th degree differential equations, which are not included in default. [13] The actual LUA version is 5.1 in OS Version 5.2 (September 2020). Since Firmware Version 5.2 it is possible to program and execute Python (Version 3.4.0 in September 2020) scripts in an interpreter or from the main calculator commando guideline. Available Python Modules (User modules can be loaded from the file system as well) Standard modules `__main__`, ctypes, micropython, array, Erno, random, binascii, gc, re, time, buildings, hashlib, silks, cmath, hopes, collections, mathematics TI-Modules ti\_picture, ti\_innovator, ti\_draw, ti\_st Lab Cradle The TI-Nspire Lab Cradle was introduced in 1994. This is a portable data collection device for the life sciences. The CBL system was replaced by the CBL 2 in 1999. The TI-Nspire Lab Cradle has three analog and two digital inputs with a sample rate of up to 100,000 readings per second. The cradl also has 32 MB storage space to store sensor data. [14] The Lab Cradle enables the TI-Nspire series to communicate with older Calculator-based Laboratory Systems that used previous TI calculators (TI-73 series, TI-82, TI-83 series, TI-85 and TI-86). [15] The TI-Nspire Lab Cradle used the rechargeable battery of the TI-Nspire and three different Supports: wall adapter, USB cable to computer and TI-Nspire Cradle Charging Bay. The TI-Nspire Lab Cradle is marketed by Texas Instruments and developed part of an ongoing business venture between TI and Vernier Instrument & Technology of Portland, Oregon. TI-Nspire Navigator System The Navigator system enables teachers to connect various TI-Nspire calculators to a computer through the TI-Nspire Access Point and TI-Nspire Navigator Wireless Cradles. The system includes the TI-Nspire cradle loading bay and the main system that resembles a wireless router. The Navigator system was first available when the first generation Nspires was launched, but when the TI-Nspire CX and CX CAS were released, a new wireless adapter was announced which is smaller, but not compatible with the TI-Nspire and TI-Nspire Touchpad. Press-to-Test Press-to-Test is a feature that restricts the user's access to the user's documents and certain features of the calculator for a limited time. The aimed goal is to avoid cheating on tests and examinations. Press-to-test is enabled by pressing a certain button combination when the calculator turns on. The features blocked (for example 3D charts and dragging & drop for graphs) can be selectively enabled, but access to existing documents is always prohibited. When the handheld runs in Print to Test mode, a LED flashes on top of it to indicate that Print-to-test is not disabled. Print-to-test can only be disabled by connecting to another calculator or a computer with TI-Nspire compatible software. If you remove the batteries or press the recovery button will not disable it. Ndless Ndless (alternatively stylized NdI3ss) is a third-party jailbreak for the TI-Nspire calculators that allow indigenous programs, such as C, C++ and ARM assembly programs, to run. Ndless was initially developed by Olivier Armand and Geoffrey Anneheim and released for the Clickpad handheld in February 2010. [16] Organisations such as Omnimaga and TI-Planet promoted Ndless and built a community around Ndless and Ndless programmes. Ndless, low-level operations can be achieved, for example overlapping, so that hand devices can run faster. Downgrading prevention can also be defeated. In addition, Game Boy, Game Boy Advance, and Nintendo Entertainment System emulators exist for handheld with Ndless. [17] Great Ndless-powered programmes also include a port of the game Doom. [18] Unlike Lua scripts, supported by Texas Instruments,[19] Ndless is actively countered by TI. With the company notoriously trying to block Ndless from every subsequent version of its OS.[20] Technical Specifications Texas Instruments have their own property system-On-Chip of the ARM9 32-bit- The first generation of the TI-Nspire is based on LSI Corporation's (now Broadcom Inc.) Zevio designed while the CX and CX II generation were built with Toshiba's Integrated Circuit design. Most Texas Instruments calculators contain only a non-volatile read-only read-only read-only called NAND Flash and a volatile random-access memory called Synchronous Dynamic Random Access Memory or SDRAM. The NAND flash is not feasible, but contains parts of the operating system. However, the TI-Nspire also uses NOR ROM to store bootloaders for the operating system. Texas Instruments probably did this to free the NAND Flash, and SDRAM in the calculator that will be used by the user and operating system. [9] The NAND Flash and SDRAM are used to store user and operating system documents. Previous Texas Tools calculators have a backup button cell battery used to maintain user information, system information and time and date, between battery changes. This allows a user to retain their information when a battery is removed. Because the TI-Nspire is not missing this backup battery, the SDRAM content is deleted when the user needs to swap the battery. It is essential that the calculator load the operating system and file structure of the NAND Flash to the SDRAM, causing a longer loading time. Despite the overall performance increase between versions of the TI-Nspire, performance differences exist. The TI-Nspire CX II version is missing 10+ MB storage location compared to its predecessor. The TI-Nspire CM-C and CM-C CAS (the Chinese versions of the CX and CX CAS) are cheaper and have an updated design, but has only 32MB OF RAM and no port for the wireless module. [9] TI-Nspire CAS & Non-CAS TI-Nspire CX CAS & Non-CAS TI-Nspire CX II CAS & Non-CAS Display 320x240 – 4 bit greyscale LCD Dot-Matrix 320x240 or 240x320 – 16 bit color LCD 320x240 or 240x320 – 16 bit color LCD CPU ARM9-26EJ-S 90 MHz/120 MHz ARM9-26EJ-S 132 MHz[21] ARM9-26EJ-S 396 MHz SDRAM 32 MB (32 MB user-accessible)[22] 64 MB (64 MB user-accessible) 64 MB (64 MB user-accessible) NAND Memory 32 MB (15 MB user-accessible)[23] 128 MB (100 MB user-accessible)[24] 128 MB (90+ MB user-accessible)[25] Flash ROM 512 KB NOR ROM 512 KB NOR ROM 512 KB NOR ROM Link capability Mini-USB Sync TI-Nspire Lab Cradle Wireless Network Adapter Mini-USB Sync TI-Nspire Lab Cradle Wireless Network Adapter Mini-USB Sync TI-Nspire Lab Cradle Wireless Network Adapter I/O Interchangeable Keypads TI-84 Keypad TI-Nspire Keypad 71 Switch Keypad Power 4xAAA batteries Rechargeable 1200 mAh lithium-ion battery Rechargeable 1200 mAh lithium-ion battery Release 2007 , 2010 (Touchpad version) 2011 2019 Operating System Versions The TI-Nspire CX/CX CAS calculators are now running the operating system (OS) version 4.5.1.12, released in April 2019. The TI-Nspire CX II/CX II CAS run version 5.2.0.771, released in September 2020. The operating system has been updated regularly since 2007 (partly due to errors and missing functions, and also to patch jailbreak exploits), one year his release in 2006. Version 2.0, 3.0, 4.0, and 5.0 were major upgrades. 1.0.491 (June 2006) – – 1.0.526 (September 2006) – Prototypes 1.1.8916 (Late 2006 / Early 2007) – Prototypes 1.1.9170 (7 May 2007) 1.1.9253 (non-CAS version) 1.2.2394 (30 August 2007) 1.3.2438 (8 January 2008) 1.4.11643 (9 July 2008) 1.6.4295 (29 October 2008, released 9 December 2008) 1.7.2741 (19 May 2009, released 6 June 2009) 1.8 (build 80) Dev (Late 2009) – Prototypes 2.0.0.1188 (5 March 2010) 2.0.1.160 (3 May 2010) 2.1.0.631 (17 July 2010) 3.0.1.1753 (April 2011) 3.0.2.1.1791 (May 2011) 3.0.2.1.793 3.1.0.392 (7 September 2011) 3.2.0.1212 (June 2012) 3.2.0.1219 (June 2012) 3.2.3.1233 (December 2012) 3.2.4.1237 3.6.0.546 (December 2013) 3.6.0.550 (February 2014) 3.9.0.461 (May 2014)[26] 3.9.0.463 (June 2014) – highest version for the original models 3.9.1.38 4.0.0.235 (March 2015) 4.0.3.29 (December 2015) 4.2.0.532 (February 2016) 4.3.0.702 (August 2016) 4.4.0.532 (January 2017) 4.5.0.1180 (September 2017) 4.5.1.12 (April 2019) 4.5.2.8 (October 2019) 4.5.3.14 (September 2020) – highest current version for the CX models , although subject to change 5.0.0.1683 (April 2019) 5.1.0.177 (August 2019) 5.1.3.73 (February 2 5.2.0.771 (September 2020) Added functions in OS 2.0 Start with OS 2.0, additional features have been added to increase the usefulness and usefulness of the TI-Nspire. Below are major changes made. These features have so far stayed at the Nspire series. Scratchpad (Easy and quick use a calculator and chart) New, more organized home screen Calculator application changes The solving systems equations (linear or non-linear) Complex and actual roots of polynomial derivatives at one point Remainder, quote, coefficients, and degree of polynoma common divisor Central differ quote with steps Creation of zero matrix New programming capabilities Capabilities Ability to separate a programming page from a calculator page Request and RequestStr I/O Features Output Text Graphs Application Changes Can Switch Table of Values Can Object Selection Guides Fit sequence graphs Zoom hidden from Hiding Chart Menu Zero Minimum Maximum Maximum Crossing Infection Di/dx Integral New Geometry application is simply a graphene application that can only make shapes data and statistics application changes to add X and Y variables with frequency Notes application changes . New chart settings page added features in OS 3.0 Images can be included in TI-Nspire documents using computer software. They can then be displayed on the Nspire calculators and in full color on the Nspire CX calculators. Graphs can be drawn on top of the images. A data collection application is included in the OS, for use with the Lab Cradle. 3D graph is supported, as well as differential equations. Other features have also been added, including improvements to related to statistics. [27] OS 3.0 also adds the programmes written in Lua. [12] OS 3.0.1 introduced a number of errors,[29] but most of these were fixed from 3.0.2. [30] In OS 3.2, conical equations can be engraved into standard formats and a new chemistry function, Chem Box, allows users to write chemical notations. [31] OS 3.2 also saw the inclusion of the Chipmunk physics engine for use in Lua programmes. [32] In OS 3.9, the area between curves can now be calculated on the graph bar. [33] Added functions in OS 4.0 An indicator now displays the corner mode (Degrees, Radians or Gradians) in effect for the current application. In window settings on graphs, exact inputs such as 7/3 or 2<sup>π</sup> can now be used for input of custom window settings. [34] Added features in OS 5.0 OS 5.0 are currently exclusive to the CX II/CX II CAS and their -T counterparts. These features have been added in this release. Animated road plot Moderator Moderator Interface Dynamic Coefficient Values Points by Coordinates Mark Labels Various TI-Basic Programming Reinforcements Simplify CAS (CAS-Model exclusive) Loose Wizard (CAS model exclusive) Added features in OS 5.2 OS 5.2 are currently exclusive to the CX II/CX II CAS and their -T counterparts. These features have been added in this release: Python programming language support in Host Software and on the calculator.
