Smartboard games kindergarten

From Matt Logan Smart Tables, like any other computer component, use the action. With the cost of electricity soaring and resources like oil falling, energy consumption has become a major concern for many people. Power usage can be calculated using a few simple formulas, depending on the information available. Determine the power used by the Smart Board. This is usually found either on the back of the device or in the manual. See Tips if power is not listed. Multiply the power by the number of hours per day the device is used. (Watt x Hours per day) Multiply the power product and hours per day by the number of days the device is used per year. (Watt x Hours per day x Days used per year) Divide its result (Watt x Hours per day x Days used per year) by 1000. This gives you total energy consumption per year in kWh. The formula used is: (Watt x Hours per day x Days per year) ÷ 1000 = kWh Use the power provided on the smart board specification sheet, on average use of four hours per day and possibly 100 days of use, and the equation plays out like this: ((1.5 watts x 4 hours) x 100 days) ÷ 1000 = kWh per year ((1.5 watts x 4 hours) = 6 watt hours per day (6 Wh x 1.00 days) = 600 watt hours per year 600 watt hours ÷ 1000 = 0.6 kWh per year Update: 08/31/2020 by Computer Hope Alternatively referred to as a video game, A game is software code designed to entertain or educate a person. Today, computer games are a great business, and there are millions of different computer games enjoyed by people of all ages. The image shows a screenshot of a computer game known as WarCraft II by blizzard. What are the type of games? There are many different kinds (types) of games available today. Below is the most popular type of games in alphabetical order. How are computer games done? The code for the games is created using a programming language. Graphics contained in the game that are not created by programming are created by using an image editor. If the game uses animation or 3D modeling animation software is also used. Just last November, investment banking firm Bear Stearns reported that games as a category would grow significantly faster than TELEVISION, radio, movies, music and newspapers, and seem to have been up on something: Americans' spending on video games last year reached an incredible \$4.6 billion, more than the total amount spent on movies (rental and theater combined). combination). Games are a far from the classic Atari of the 1970s, which created most modern gaming gurus. Three-dimensional characters move in all directions in surprisingly detailed animated worlds, using complex moves that would put Bruce Lee to shame. So this may explain why more than 90 percent of toys are currently purchased by someone over the age of 18 (for themselves or for other household members). Three systems currently rocking the gaming world: Sony's PlayStation 2, Nintendo's GameCube and Microsoft's Xbox. It's all hits for different reasons, so you just need to choose which features are aimed at you. And rest assured: Your purchase won't be outdated by the time you get home; dramatically different systems are not expected for about two years, although fun new accessories are hitting the market every day. PlayStation 2 PlayStation 2: The Leader of the Pack Sony's PlayStation 2 (PS 2) (\$199) is the overwhelming leader with more than 11 million systems sold in North America alone. It can play titles that are developed specifically for it, except those made for its predecessor. (This model is now repackaged and sold as the PS One for \$49.) The combination means PS 2 players can choose from more than 1,200 games, four times the number available for GameCube. Many of these games, of course, were written a long time ago and do not meet today's standards. PS 2 is a steal because it can play DVD and CD and boasts Dolby 5.1 surround-sound support. GameCube GameCube: Nintendo's smallest GameCube (\$150) is the cutest of the bunch, measuring about 6 inches on each side, and includes a built-in handle. It uses a proprietary mini-CD, so it can't play standard CDs or DVDs. It does not have a hard drive, so it uses a memory card such as PS 2 to record settings and results. And although it has the least number of games available include exclusive offerings like Pokemon, Zelda, and Mario titles (such as Super Mario Sunshine, which sold more than 350,000 copies in the first 10 days was available in stores). Xbox Xbox: The most powerful Microsoft Xbox (\$199) has an internal hard drive, built-in network slot, and claims to have the most powerful processor and the best graphics processing of the three systems. Uses standard-sized CDs. To play DVDs, you'll need to buy a \$30 adapter. It is compatible with and some new TVs now have built-in Xbox support. Company Three: What they have in common You will find similarities between the three systems. All the boxes just plug the wall into your TV. Each box has a specially designed 128-bit processor chip. So when you're shopping around and you see the PS 2 box boasting that it has a 128-bit processor with 295-megahertz (MHz) clock speed, it means the chip can handle 128 yes-or-no decisions 295 million times per second.) The sooner the machine can make decisions, the faster games tend to run-and the more detailed they can be. The chip that runs each box is unique, which is one reason why games written for a box will not run for others. (All three systems have games that are exclusive to their respective platforms, although many titles are available in all three flavors.) Each box is accompanied by a game controller, a cross between a game keyboard and a joystick, but up to four people can play at the same time if the game title and system support it. Additional or upgraded controllers are available from various companies. Xbox and GameCube have four controller ports. PS 2 has two. Most current models look like a bow, with two short hands on both sides and activate at the front where your pointer rests. Many controllers can now vibrate, allowing you to feel the experience, and wireless models for all three systems are in stores (a must-have if the sofa is too far from the TV). Of the three, the PS 2 controller (included) has the most outdated design with flat buttons instead of full triggers. Web Wars: Online Gaming The Biggest News This Season? Online gaming, which gives you the opportunity to compete with other players around the world. Microsoft's Xbox, which has built-in online gaming support, was scheduled to launch the Xbox Live gaming portal in November. Sony released the \$40 network adapter for its PS 2 in August to allow play over analog and broadband Internet connections. Nintendo was expected to release \$35 modems and broadband adapters before the holidays. A broadband connection (such as a cable modem or DSL phone line) is encouraged for the online connections of all three systems and is required for the Xbox Live service. Microsoft said the company will charge \$50 for the Live package, which will include a year of access with headphones and microphone for voice chat. The other two companies said they would not charge consumers for online gaming access, but their game developers can. Good news for gals While there are still many video games where ladies are nothing but bouncy window dressing, strong female characters have become surprisingly popular in games marketed for women and men alike. Headliners include names such as Lara Croft and Jennifer Tate of Primal (PS 2), but even games where women don't play a leading role (such as GameCube's Eternal Darkness, which features women in the time-traveled composition of heroes) begin to give female characters a backbone. That may be why 43 percent of the game's players are now women, according to the Interactive Digital Software Association, and why movie spin-offs like Tomb Raider are a hit at the box office with both sexes.
