After the os successfully checks out the message, the os calls a function that can be performed by the driver. The driver then uses binary code to command the hardware to execute operating system commands and also to restore the data that the hardware is running. Virtualbox). In GNU/ Linux, the Linux kernel can take care of several operating systems at the same time, with an online machine setup acting as a software driver. Driver software works constantly in bit setting. What distinguishes it from device drivers is that device drivers do not work in bit mode all the time.
