To make this roughly mince more efficiently use Yuty eggs, as it is easy to breed and lay eggs or go to Valguero to steal all the Deinonychus eggs you see. While Deinonychus only randomly lays generic raptor eggs, deinonychus eggs are placed during breeding. With sufficient amounts of Deinonychus, you can make an effective fertilized egg farm instead of traveling to collect wild eggs. This has the advantage of much less space than the Yutyranus egg farm, although the time between laying will be higher due to breeding timers. For tribes suffering from property shortages, this space saving can be worth while. At Crystal Isles, you can breed the Crystal Wyverns. Breed them and use their eggs.

Extraordinary roughly mince are just as effective taming creatures that tend to lower roughly mince levels. It's not available on the switch, as the tile used to say, but if the new DNCs are released, then there's a good chance that the whole Tanya patch will come to Kibble with food products used by gentle creatures more quickly and with greater affinity, allowing players Save time and end up with better stats for your tamed pet. The Kibble system has been reworked by ARK: Tanya Tanya and is currently available on all platforms except mobile and Nintendo Switch versions. Instead of kibbles based on eggs, the Kibbles are replaced by quality-based types: Basic, Simple, Regular, Superior, Exceptional, and Extraordinary. The egg-based kibbles are still in the game and are able to use; however, it is no longer craftsmanship. They are also categorized into one of the 6 quality-based types. All eggs (except Araneo eggs and moth eggs) are now one size and can be used to create a suitable quality based on roughly mince. In Mobile and Nintendo Switch versions, most Creatures have the preferred egg-based kibble, which tames the creature with the greatest taming efficiency and efficiency. However, using a roughly mince that does not favor the creature is even worse than taming raw meat or berries. Usage[edit | edit source] Roughly mince can be used to tame a creature. Although all Kibble types technically work to tame every creature, certain roughly mince will work better for certain creatures. A bad roughly mince takes longer at best, but can be only 2/3 as effective as the creature's regular food and instead reduces its taming efficiency. The creatures prefer at least one class of cobbled mincing, but they also accept a higher-class rough grind, e.g. Argentavis is most effectively tamed with excellent kibble and better, but the basic, simple and regular class achieves worse results than meat. The order of effectiveness (in terms of the duration of taming) in food to tame creatures: The value of Minced food depends on the creature and the type of food. For Kibble, it varies between 20 and 135. No favorite roughly mince gives just 1/8 of the taming progress as your favorite kince. Kibble is also used for the inking of baby dinoes. During the supply, you may want to hand-feed a randomly selected roughly mince, including the roughly mince that is not the species' preferred food. For this reason, having as many types of rough grind as possible, allowing the rate of inking to increase. Recipes[edit | editing source] Learning an Engram is not necessary to create roughly mince, and there are no Engrams available to them, but recipes found all over the world. Follow the same instructions as cooking in a cooking pot or industrial stove. In addition to the ingredients listed below, all roughly mince recipes require Waterskin to have at least 25% water in it (all other water containers work, but are completely used regardless of capacity). When connected to an aeration system, a water shell or other water tank is not required when creating water in an industrial stove. Fertilized eggs can also be used to kibble. Creatures are a great way to generate eggs on-demand. Cooking these roughly minced requires illuminated Cooking Pot, so in addition you need to fuel the fire. It takes 30 seconds for 1 roughly minced to cook to cook a cooking pot. See also: Eggs in the list and size of eggs. Recipes (Mobile)[edit | editing source] This section is about a feature exclusively available for mobile Although these kibbles are no longer craftable for pc and console, they are still craftable by ARK: Survival Evolved Mobile. They are crafted with a cooking pot, industrial stove, or TEK Kibble processor. The value of the kiúlú is used to determine the amount of loophole required when using the TEK Kibble processor and the finesse yield. Roughly mince system like v297.35 Overview funnel taming requirements and taming in general. Resources needed for taming such as v297 Use as a regular food[edit | editing source] Kibble can be used as a regular food for tamed dinos. The mince takes 3 days, which lasts longer than most other types of food. It also stacks 100 and weighs little like other foods. The minced minced for a long time and preserved in a preservation bin or refrigerator (Refrigerator recommended, since the deterioration time has increased significantly). The portion of food in a roughly mince depends on the type of mince and whether the roughly mince is preferred by a particular dino. Most dinos gain 80 food from the preferred roughly minced, even if other dinosaurs would win more. There are exceptions; For example, Daeodons gain 120 food from the preferred roughly mince (Iguanodon/Superior), which usually only gives 90. Aside from giving preference to dino, roughly mince gives either 60 or 90 food roughly mince. Loopholes carrying 90 foods usually require prime meat jerky, and from v257 are: Ankylo, Araneo, Archaeopteryx, Argentavis, Ichthyornis, Iguanodon, Dilluchus, Mank, Megalosaurus, Microraptor, Moth, Oviraptor, Pulmoscorpius, Quetzal, Rex, Spino, Stego and Tapejara Tape. Each other roughly mince gives you 60 foods, unless you benefit, of course. Because of these properties, using Kibble as a regular food can be helpful in some cases. It's like leaving your creatures behind for a long time, because you have to fill the supply of creatures less often. However, farming Eggs is still very time consuming and expensive, so it is not usually recommended to use it as a regular Dino food. When using Kibble for this purpose, we recommend that you use easy-to-create loophole types, such as Dodo Kibble. Super Kibble (Mobile)[edit | edit source] Main article: Super Kibble This section is about a feature that is only available on Mobile Super Kibble, a kind of kibble exclusively for ARK: Survival Evolved Mobile. These kibbles can be crafted into a cooking pot or an industrial stove replacing normal eggs with a Super Fertilized Egg. They can be used to tame creatures faster and have greater taming efficiency. Notes[edit | edit source] If the Kibble passive is gentle by making the last slot in the hotbar, keep in mind that if Pegomastax steals it, you can eat the whole stack! If you are trying to make roughly mince and nothing is made of the right ingredients, try to make a cooking pot or industrial stove. Some updates render the finesse host inoperable in some ways. The DLC Primitive Plus Kibble does not work for taming. Since 2019, many users have reported this issue. 2019.
