It takes less than 3 seconds to create hard-to-read text and tips on how to make a game with friends You just need to type or copy the text in the input box. Immediately Invisible Ink fonts will be converted at the bottom. Synthetic alphabets are used to replace existing letters: ABCDEFGHIJKLMNOPQRSTUVWXYZ Copy and paste anywhere you want. It can work even on social networks like facebook, twitter, instagram. The text you see is essentially unicode characters. What is the application of invisible fonts? You can use it as a captcha. A hidden text as a discount code. It will look mysterious and give the feel like the codes they reward on scratch cards. Implicit messages for example a textange for example for friend. With a message for your lover you want to be a little hard to read, why not combine with common fonts (a handwritten type of font) will be very similar to a love letter rather than dry as the standard font of the machine right? In addition, if you want to hide a piece of text completely in CSS, this the attribute you are looking for: style=display: none; Some more female font options for you here Twitter font #InvisibleInk #fontgenerator #wonhowto #invisiblefont Post by Son Nguyen · in 25-04-2020 · view: 6729 Get under the special blank text, and use it everywhere you can't set « nothing as a label » usally. For example: iOS folders name, bookmark labels, Windows shortcut name, twitter profile name, ... As simple as « 1, 2, 3! » 1. Select this empty text [ ] with the button below Select 2. Copy the selected text from clipboard 3. Paste this blank text anywhere you want to show « nothing » Read the full procedure on the FAQ page. Whitespace characters denote the empty space between all the characters you can actually see. They have width (height if you type vertically), some special rules, and not much else. The most common white space, the word space is the word space The one you get when you press the space bar. Generally speaking, blank space is any empty area of a design or composition; the margins of a book, or the sky in a painting: It's as simple as that, but it's often white space that distinguishes good design from bad—almost always because there isn't enough of it. Great type, even huge type, can be beautiful and useful. But poise is usually far more important than size - and poise consists mainly of emptiness. Typographically, poise is made of white space. Robert Bringhurst — The elements of typographic style above apply especially online. Web developers tend to squeeze as much information on to your screen as possible. A common criticism of this site is that there is too much wasted site. This is wrong. The opposite is true. The more crowded a composition, the less weight is borne by each individual element. When you design a website or document, you can use white space to distinguish important information. Online (especially on social media), you are often limited to the white space specified by Unicode. While most of these characters do little but add some white space in very special situations, it's worth getting to know them a bit. Using them effectively can and help your writing seem more authoritative. The word space is the character you receive when you press the space bar. It is the most common whitespace character. The word space is a sign with an inherent conflict of interest: the space must be wide enough to distinguish individual words, but narrow enough to encourage grouping into sentences and paragraphs. Karen Cheng — Design Type Word space is used to separate words and sentences. You know it already – but there are still a couple of pitfalls to be aware of when using it. Don't use two spaces between sentences. Sometimes people add two spaces after a period. There's a logic behind this—which the parts of your writing get so make space between them. letters → words → sentences → paragraphs But a period is mostly blank space. So sentences already have more space between them than words. The type designer of your chosen font will have taken this into account. Don't do this.  Here's what you do. See? The word space also tells your word processor, or browser when it's okay to break on another line—but this isn't always what you want. If it is important for the flow of your writing that two words never be apart, you should insert a no-break space. You can space two words, as normal, without the possibility that they are on separate lines. MacOS / Windows ctr-shift-space ENTITY HTML &amp;nbsp; Unicode U+00A0 Use the hair space when two characters are just a tiny bit closer than you want. Kerning on the fly You can use the hair space to add kerning (space between two individual letters) in circumstances where you normally can't, like on social media. For example, the double struck characters generated by the Fancy Font Generator? may have terrible kerning. With the help of a hair space, you can fix it. So kerning becomes kerning. HTML Entity &amp;#8202; Unicode U+200A These two are about the same. Just like in the hair space, they are used to create some extra space between the characters. Both are about one sixth of an Em in width. A specific use of the thin space is to make quotes in nested quotes: Clive told me Prof. Reginald said don't use nested quotes Thin Space HTML Entity &amp;thinsp; Unicode U+2009 Six-per-em Space HTML Entity &amp;#8198; Unicode U+2006 Punctuation takes up as much width as a period. It also acts as a non-break space. Some languages have white space before a punctuation mark. This space is used in these circumstances. HTML Entity &amp;; Unicode U+2008 A shape space is used only for distances to fixed-width numbers. Its width is the same as one of the numbers. The ideographic space, similar to the figurine space, is used with fixed-width CJK characters (Chinese Japanese Korean). Image space HTML Entity &amp;numsp; Unicode U+2007 Ideographic Space HTML Entity &amp;#12288; Unicode U+3000 The space of three per em and four per em is one third and a quarter the width of one em. Three-per-em Space HTML Entity &amp;emsp13; Unicode U+2004 Four-per-em Space HTML Entity &amp;emsp14; The Unicode U+2005 Em space is the width of a large M-capital, which also happens to be the height of most fonts. The one-space is half the width of an Em. Em Space HTML Entity &amp;emsp; Unicode U +2003 A Space HTML Entity &amp; ensp; Unicode U +2002 This is my favorite-it's not really a space. It is meant to represent a Braille pattern with six-non-superscript dots. So it shows as empty or sometimes six hollow dots. This means that can use this space places where you normally can't, as in URLs. HTML Entity &amp;#10240; Unicode U+2800 The paradoxically named zero-width space has an odd job to do. It lets your browser know when it's okay to break a word on a new line, without hyphenating it. Useful, perhaps, but the ability to use an invisible character without width has serious cybersecurity implications. Hackers can create usernames, email addresses and websites that look identical to a human, but are different from computers. Fortunately, spaces with zero-width spaces in email addresses or domain names are prohibited – and that is a well-known problem. You are unlikely to be fooled this way-but it has happened. On the upside, there are some genuinely useful things you can do with a zero-width space: Stop auto-linking You can stop social media from automatically turning a URL into a link, without breaking up the text in the link. Blank form inputs You can use all these spaces to fill inputs with white space, but the zero-width space seems to work in a few places that the others don't. Prevent Information Leaks This idea comes from cyber-security guy Zach Aysan If your company has a leaker, you can add zero-width spaces to sensitive documents—hidden in different locations for each of the recipients. Once the material has leaked, you can check it for zero-width spaces to determine the identity of the leaker. Send secret messages You can use zero-width spaces to hide a coded binary message in a piece of text. For example: t h e re is a h i d d e n e moji in th i s HTML Entity &amp;#8203; Unicode U+200B While most of these tricks are only useful for web developers–I can think of some scenarios where these characters could help you stand out on social media. Let me know if you come up with any fun uses for these characters. Characters.
