The Gunk Medich engine flashes exactly that - it's a simple flash engine that hits all the right notes. Gank Medicin Flash Engine is a local family-owned company based outside Charlotte, nc. Make sure this fits by entering your model number. In addition, a fast product is a stage that does not require neutralizing and does not contain any acid. Most importantly, Gank motorized medical engine flash is compatible with all cooling systems. One customer says - this product should be if you'd like to take care of your car and kindle cooling the right way. . They also found that the beautiful thing is that the engine runs perfect again..... No clacking sound is uglier. Why we like this:Gunk 10 minute flash radiator quickly removes grease, dirt, rust and scaleLot from satisfied buyers5. Stp Motor Medical Engine Flash Stp Motor Medical Engine FlushWe know from years of feedback from readers, Amazon vendors, and family and friends what most people want in a proper engine flash. Stp Medich engine flash engine exactly that - it's a simple engine flash that hits all the right notes. Ultra-focused cleaning agents actively make clean deposits on the engine. Safe to use any oil change when used as directed. To sum up, with a score of 4.4 and more than 144 buyers, the stp motor doctor's engine flash stands as the best choice. Generally many have been using engine kindle for more than a few months without any problems and show no signs of knocking. Why we like this:Helps reduce sludge in scientifically engineered cylinder heads to improve oil discharge for vehicles over 75k milesHelps reducing sludge and lacquer in the head of artificial cylinder flash engine; 32 ounces. Synthetic MEDIC motor flash engine is a unique combination of synthetic solvents and oils that effectively remove gum, lacquer, sludge deposition and release sticky valves, lift and improve oil circulation. Safe to use with all engines, including gas and diesel engines with turbo charge. Do not damage the seal or cause wearing bearings when used as directed. Artificial flashing of the engine is an inexpensive way to clean the components of an engine. Features & Benefits: Improves oil circulation No damage to seals No bearing wear Cleans engine in 5 minutes Recommended before each oil change Helps remove engine deposits Made in the USA Directions for Use: Check to make certain oil in crankcase is up to safe level Add MOTOR MEDIC Synthetic Motor Flush to a cold engine before changing oil and filter. Use the whole bottle, idle engine at normal speed for 5 minutes. Don't drive the car, drain the lame and take the oil filter. Replace the drain plug and install the new oil filter. Note: In engines with high mileage (as one of 50,000+) or deposit too, remove and clean Pan and oil screen. Re-fill the lame with new oil. . Discussion started • #1 • June 3, 2014 My 2000 4X4 border just over 200,000 miles on it. I almost kept up with oil changes at regular intervals (mainly conventional oil), maybe a few times going 7,500 miles or more between oil changes, maybe once going even longer than this. A manager at a auto parts store spoke to me to buy a bottle of Engine Medich Flash engine, and he said it would be like unclogging arteries on an older person. However, the instructions show the first removing the oil pan and cleaning it inside to minimize engine damage with flash. Removing the oil pan is not even an option for me, as it needs to eliminate all these other things and secure the engine on top on top. I can imagine how much a mic is charged for removing and cleaning the oil pan so, I either want to use a doctor's flash without cleaning the oil pan first, or I don't want to use a doctor's flash at all. Do you have any suggestions? Will it be safe to use a doctor's flash on my engine without cleaning the oil pan inside? I have read both the good and the bad story of using these issues. . The problem with using products like that with high mileage is that your engine, no matter how well you take care of it, will have some sludge build. When you remove those slimes, a few things may happen. 1. You almost certainly develop leakage because the sludge was blocking the leak in the old seal and gasket. 2. That sludge will likely be completely broken down when it is blocked from engine surfaces meaning that you have chunks of crud flowing through your engine which is terrible for lubrication and likely some important oil orifices that are important areas of the oil engine. It is also why you have to switch to synthetics on a vehicle that has high mileage as synthetic oil contains far more detergent that performs the same additive thing. If you are to use products like that or seafoam, you need to do it early and continue it so that the buildup amount that removes it is limited in a time. If you use it now for the first time, my money says you're going to have a toll. As Joe said if it doesn't fail, don't try and fix it. . Two reasons to use this product. 1. You car has been sitting with the same oil in it for at least 1 year without any driving. 2.You've driven 20 or 25 thousand miles in the same oil/filter. I respectfully disagree. If the oil is sitting without driving just drain it, drop and clean the pan, and reload with the new. If you're driven 20-25k miles unchanged by your oil, your engine is developed away The sludge of it should be during that time so the reasons for using it in my first see, your engine will take a little longer but it's borrowed in time. The only reason to use such a thing is preventive maintenance and should be done early in motor life and often. I suggest doing it almost every 50k miles along with manufacturers suggesting maintenance if you really want to use something like this. . Oh, he's wrong! (Sassi's schoolgirl voice) engine flash is somehow the last ditch attempt to save an engine. It's definitely not preventive maintenance. I think this product is trying to mimic a real engine done by a proper mic? If so, you don't want to use it. . i would never use such a product . Untmerst some gunk, will it float around and jam up the oil lifting pump? Yep. The engine goes goodbye. . no way... Crap in one can last ditch repair before you sell the vehicle. . You are more likely to fail than to block an oil passage with slime and starvation part of the moving of lubrication. - I'll never add these fluids, Clint. Oh, he's wrong! (Sassi's schoolgirl voice) engine flash is somehow the last ditch attempt to save an engine. It's definitely not preventive maintenance. I think this product is trying to mimic a real engine done by a proper mic? If so, you don't want to use it. As I said, if you are using this type of product it should be done as preventive maintenance. Trying it on an engine with a bunch of sludge will likely ruin it. Using it as a form of preventive maintenance is not likely to do the same damage, though still something I don't recommend. Personally I just use it as a paper weight or for target workouts, no way... Crap in one can last ditch repair before you replace the engine. FTFY your car will be worth less with a toasted engine than just running like crap... Off topic..... What's a footy? lol. . I'd go through it if he's worried, pull a vent cover and see how much sludge you have on the cover. I have over 200K in my gen1, 10k oil shift intervals with synthetic. I can't say there's no build, but it's not so much compared to the other engines I've seen nor enough to concern me. . I think this product is trying to mimic a real engine done by a proper mic? If so, you don't want to use it. And what, pray you say, is a real engine kindle done properly by a mechanic? That's not the case unless you're talking about pulling the engine, ripping it off and tanking hot blocks. Anyway to op question, drag the oil filler cap off and shine the flashlight down the filling pipe. If I see chocolate, consider the renovation. If you see shiny metal, it has continued to change oil like you do and enjoy another 200,000 miles in your truck. Get that snake oil back to the store and get your money. If you feel you want to do something, add some Marvel mystery oil to the lame per oil change (as per instructions). - Those things actually work to keep the seal safe. Well, it's explained to a friend of mine in a local Mazda corridor. It's basically just pumping a creater solution through the engine where the oil goes. Have you ever seen plumbers install pipes on new construction? Apparently they use a similar chemical to clean the system. It's yellow and it smells terrible, but they push it while they bleed the pipes and relax/dissolve all the crap. They constantly fill and drain this liquid through the building until the clean liquid comes out. I assume thats how the bike ends. . I would never offer any engine I own to it unless I was able to wash it and oil everything by hand before it started so it happened. That's your friend's caustic solution in stealing Mazda which is probably talking about the standard white oil-based engine kindle that op was sold. Debatable as a preventative, terrible measure as a fix-all. . Start discussion • #17 • June 4, 2014 Thank you all for your answers. - I don't want to use those things. I will never add chemicals to oil about lame, transmission or di differential. There are many cheap rubber and plastic parts made that these chemicals can attack. I had a Toyota that had engine failure because the normal engine oil took away the plastic timing chain guide and caused the cooling to get into the lame case. The same truck had an oil factory manually manually dissolving the shift lever liner. If conventional oil can do this kind of damage, think what mystery cleaning products can do. My border in 2003 has attacked the gasket covering the bad valve because of the detergent in cheap rubber engine oil. John John
