Chat with, email or call Yahoo //help.yahoo.com//us/yahoo/mail/yahoomail/fo...Customer Care Email Addresscc-advoc@yahoo-inc.comYahoo Philippines - Asia Contact Info //asia.docs.yahoo.com/info/support/ UK Customer Service Call YahooUsa: 1-866-562-7219 --- 1-800-318-0631 UK 020 7131 1 000Canada: 1-877-722 3755 Live Number: 1-408-349-1572Fax No. 1-408-349-3301 in an attack that is currently the largest breach in the history of cybercrime, Yahoo accounts were hacked 1 billion. Everything from names, email address, phone numbers, encrypted passwords and more has been taken, representing another online giant as a victim of the endemic hacking folly sweeping the world. With 1 billion accounts hit (along with the less recent mail breach seen in 2014), there is a good probability that your username was one of them. Here's what you can do if your Yahoo account is compromised. #1 check your email address the reason you're checking your email address is because often this is where most hackers will start. People save loads of sensitive information in their email accounts, unaware that this is where the first hackers will be looking for profitable data when they hit. So before you do anything else, make sure you feed your information hackers everything important using an anti-intrusion security email security tool like this one. It'll sweep your accounts looking for credit card numbers, exposed passwords, and other sensitive information that sits waiting for hackers to dive in. In addition, these tools will help you remove information and alert you if anything suspicious appears in the future. #2 check your latest logins afterwards you should check what is happening with your account. You can do this by viewing your recent activity logs that can be accessed from the left menu bar on the Yahoo account page. As you can see from the screenshot, the right will show you a list of places and devices where your Yahoo account was recently accessed. If there's something that looks Or suspicious, change your password immediately. Yahoo makes this really simple by giving you a password change link right there on the activity log page, we walk you through the process in the next section. #3 change your password again, from your Yahoo account page, look through the left hand navigation of the account security link. In this section, you'll see a password change. Click on this to select a new password. When choosing a new password, keep in mind that experts have recommended avoiding standard dictionary words and personal details (such as your mother's name or your son's birthday), and instead choosing a set of numbers/letters/cases/characters that are at least 8 characters. #4 check that recovery details continue along the account security section, you'll see a section containing account recovery information. This is the email address or password used to check your account if you get locked for some reason. If you don't have one, now is the time to add one! Insert a trusted email address and a phone number that you can access all the time. This way, if you are locked out of your account, you can easily recover the account by accessing the information sent to the listed recovery information. If you already have recovery details in place, check that these are accurate. Sometimes hackers will even change one character in your email address, and change the actual email account to the one they control. This effectively gives them full access to your account without realizing it. The same can be true on the phone number you provided, so check each of this information to make sure it's accurate. #5 choosing two-step or two-step verification is a smart way to keep hackers at bay. This process requires the entry of the verification pin that is sent to the available mobile phone number when activated before you sign in to your account. The person carrying your phone can only access this code, so unless criminals steal your actual mobile device, two-step verification is a confirmed security block. To choose two-step verification, go to the Yahoo account page, and open the account security section. Near the bottom of the page, you'll see two-step verification with a switch to turn it on or off. #6 checking other accounts here is why you shouldn't use the same password on multiple accounts: Hacker is not stupid, they will take the stolen password from one account, Yahoo for example, and apply it to all your other web accounts, enabling them to run them for free across your space. The reason they can get away with this is because so many people use the same password for multiple accounts, so They've taken all the action out of hacking security for hackers. Don't fall for this easy tricky taste. Use Unique passwords for each of your online accounts. If you've already made this mistake, browse your other accounts to see if you still have access. If you do, change your passwords to new and unique passwords now. If you don't have access, try account recovery or contact customer support to reset your password. #7 get antivirus unfortunately, there are thousands of ways to hacker to mess up your life. Whether it's injury to your device with a Trojan horse or simply using your account to send spam, cyber criminals are at least industrious. For this reason you must stay ahead of them step by step all the time the only way to keep before the hacking game is to use often reliable antivirus software. There are many free versions that provide solid security, or you can pay for a more comprehensive software package (although it's not really necessary for the average atmosphere). Mobile security is also a key factor in ensuring your online security, so download free mobile antivirus to keep your cell phone and tablets protected. #8 getting help when it's unlocked is more important, if you can't access your account because of a password change, the first step is to try to recover your Yahoo account via the recovery information you provided when you opened the account. If this still doesn't work or you don't have access to these forms, then use this form to get customer support involved quickly. #9 get the LogDog app for your iOS or Android system don't worry about hacking your password. Find out how to avoid common password errors and make your password strong and unbreakable. Do you have the impression that you've been hacked? Learn how to secure any of the hacked accounts and devices. Have you received an email or notification that appears suspicious or false?
