Cisco chapter 7 quiz answers

Resumption Cisco CCNA 2 Simulation v6.0 Test Chapter 7 Questions and Answers CCNA 2 Chapter 7 Questions and Answers CCNA 2 V6.0 Copy the ACL to the text editor, remove the ACE and then copy the ACL with a different number and apply the new ACL to the router interface. Use the key word and ACE sequence number to remove. Named ACL ACEs can be removed with a resolution 192.168.10.96 0.0.0.31. the ability to specify source addresses and assignments for use in traffic based on a specific protocol ability to filter traffic based on the entire set of protocols and destination Standard ACLs (whether moderated or named) only filter to the original IP address. Having an ACL sometimes makes it easier to identify a target as well as change an ACL, when buffer memory is low when you remove ACE from the ACL while troubleshooting aCL, and you need to know how many packages correspond to a clear access counter command, it is used to reset all ace matchrelated numbers that were made within a particular ACE. The team is useful for fixing ACL issues that have recently been deployed. Four packages were allowed through the router from the PC network 192.168.1.64. Four packages were allowed through the router from the PC network were denied. Four packages were allowed through the router from the PC network 192.168.1.64. Four packages were allowed through the router from the PC network were denied. allowed via the router to reach the destination network 192.168.1.64/26. The access list team shows how many packages met the criteria for each ACE in terms of a certain number of coincidences. ACEs of the access list 10 ACEs will be removed. ACEs of the Access 10 list will not be affected. After the restart, the access list will be to first list the host's operators and thus more effectively Cisco iOS. When calculating how many ACLs you can set up, use the rule three Ps: one ACL per protocol, in the direction, on the interface. In this case, 2 interfaces x 2 protocols x 2 directions give 8 possible ACL. Unlike outgoing ALCs, incoming ACLs can be used to filter packages with multiple criteria. You can set up multiple incoming ACLs on the network interface, but you can only be used in routers and switches, but outgoing ACL after routing is completed. ACEs are usually reordered from how they were introduced by a network administrator. ACEs, which have host criteria, such as in statement, allow the highest number of bits that must fit). Access list 10 resolution 192.168.0.0 0.0.0.15.255 access list 10 resolution 192.168.16.0 0.0.15.255 access-list 10 resolution 192.168.16.0 0.0 0.15.255 access-list 10 resolution 192.168.16.0 0.0.0.3.255 ACL application access-list 10 resolution 192.168.16.0 0.0.0.3.255 will correspond to all four prefixs of the network. All four prefixes have the same 22 high-order bats. These 22 high-order bats. The advanced bats are also as a second bats. The advanced bats are also as a second bats. The advanced bats are also as a second bats. The advanced bats are also as a second bats. The advanced bats are also as a second bats. The advanced bats are also as a second bats. The advanced bats are also as a second bats. The advanced bats are also as a second bats. The advanced bats are also as a second bats. The advanced bats are also as a second bats. The advanced bats are also as a second bats are also as a second bats. The advanced bats are also as a second bats are also as a second bats. The advanced bats are also as a second bats are also as a second bats. The advanced bats are also as a second bats are also as a second bats are a applied on all R1 interfaces. All traffic will be blocked, not just traffic from the subnet 172.16.4.0/24. Due to an implicit denial at the end of all ACL, access-list 1 permission of any team must be included to ensure that only traffic from the 172.16.4.0/24 network is blocked, and that all other traffic is allowed. Place options in the following order: 192.168.15.65 255.255.255.255.255.255.240 No. the respuestas correctas Each statement is checked only until a match is detected or until the end of the ACE list. Each package that does not match any ACE. A package that has been rejected by one ACE may be ACE. The package can either be rejected or redirected on the request of ACE, which corresponds. Package that doesn't match any ACE will be redirected by default. When a package arrives at a router that has an ACL configured on the interface, the router takes the steps set by ACE (allows the package to go through or discard it). If certain criteria have not been met, the router moves on to the next ACE. Implicit denial of any statement is at the end of each standard ACL. Access to vty lines can be filtered with ACL and used with a command access class. Por favor, selecciona 3 respuestas correctas Filter unwanted traffic before it moves to a low bandwidth link. Place the extended ACLs close to the IP traffic destination address. Place the extended ACL next to the original IP address of traffic. Extended ACL should be a matching outgoing ACL. Place the standard ACL next to the original IP address of traffic. Extended ACL should be placed as close as possible to the source ip address so that the traffic that needs to be filtered does not cross the network, or use network, or use network, or use network resource and filter all traffic and restrict services to other hosts. Filtering unwanted traffic before it enters low bandwidth links saves bandwidth and maintains network functionality. Decisions to place ACL in or out depend on the R1 G0/1 interface coming to the R2 G0/0 interface Because the standard access lists only filter to the original IP address, they are usually located closest to the destination network. In this example, the original packages will come from the R2 G0/1 network. The destination is the R1 G0/1 network. Appropriate ACL placement is in the R1 G0/1 interface. When the ACL is applied to the outgoing interface to filter packages, coming from multiple incoming interfaces before the packages exit from the interface, when the outgoing ACL is closer to the traffic source, when the interface is filtered by the outgoing ACL and the network attached to the interface is the source of the network filtered into the ACL, when the interface is filtered by the outgoing ACL to be used when the same ACL filtering rules are applied to packages from more than one incoming interface before exiting the single interface. The outgoing ACL will be applied on a single outgoing interface. R1 (config-line) 1 in R1 IP Access Group 1 in R1 IP Access Group 1 in R1 IP Access Group 1 of R1 (Config-Line) Access Group 1 in R1 IP Access Grou issuing an access class command. on any router through which the package mentioned in the ACL is configured, the show access list command is only related to the traffic passing through the router on which the ACL is configured. Two devices connected to the router have IP addresses 192.168.10.x. Traffic from one device was not allowed into one router port and was a router emanating from another router port and be routed to another router port. The access class command is only used at VTY ports. VTY ports. VTY ports. VTY ports. VTY ports. VTY ports. Under the device from the network except 192.168.10.0 was not allowed to use VTY ports. The only filter that can be applied with a standard ACL is the source IP address. 0.0.0.255 Router1(config)# access-list 10 permit host 192.168.15.23 Router1(config)# access-list 10 permit or deny one specific IP address, either the wildcard mask (0.0.0.0 (used after the IP address) or the wildcard mask (0.0.0.0 To permit or deny one specific IP address) or the wildcard mask (0.0.0.0 To permit or deny one specific IP address) or the wildcard mask (0.0.0.0 To permit or deny one specific IP address) access-list 10 permit or deny one specific IP address) or the wildcard mask (0.0.0.0 To permit or deny one specific IP address) access-list 10 permit or deny one specific IP address (0.0.0.0 To permit or deny one specific IP address) access-list 10 permit or deny one specific IP address (0.0.0.0 To permit or deny one specific IP address) access-list 10 permit or deny one specific IP address (0.0.0.0 To permit or deny one specific IP address) access-list 10 permit or deny one specific IP address (0.0.0.0 To permit or deny one specific IP address) access-list 10 permit or deny one specific IP address (0.0.0.0 To permit or deny one specific IP address) access-list 10 permit or deny one specific IP address (0.0.0.0 To permit or deny one specific IP address) access-list 10 permit or deny one specific IP address (0.0.0.0 To permit or deny one specific IP address) access (0.0.0.0 To permit or deny one specific IP address) access (0.0.0.0 To permit or deny or den traffic that is not specifically denied. The ACL will block all traffic. The ACL should only be used when entering. Since there is a denial of any ACE at the end of each standard ACL, the effect of having any ACE to access list 1. Manually add a new ACE failure with a sequence of number 15. Manually add a new ACE failure with a sequence number of 5. Create a second access list that denies the host and apply it to the same interface. Because ace's new denial is a host address that falls under the existing network which is allowed, the router rejects the command and displays the error message. Error. The new ACE waiver will take effect, it must be manually configured by the administrator with a sequence number that is less than 10. All movement is allowed. The ACL doesn't work as it's intended. The ACL will analyze traffic after it is routed to the outgoing interface. Always check the ACL to make sure it works in the way it was designed. Applying an ACL that is applied via an IP team access group instead of using an IP access group from the team will not work as intended. CCNA 2 Chapter 7 v6 Exam Answers Congratulations, You have completed Chapter 7 CCNA Exam 2! Tell us your rating! Rating!
