## Chase mission and vision statement

Endocrine Today aims to be a global, ultimate source of information for endocrine professionals by providing timely, accurate, authorial and balanced reports on clinical issues, socioeconomic topics and industry development, and presenting clinically relevant information on medical treatments for the benefit of the patient. The President's Council's mission is to increase participation in sport among young people of all backgrounds and abilities and to promote healthy and active lifestyles for all Americans. Through partnerships with the public, private and nonprofit sectors, the President's Council promotes programs and initiatives that motivate people of all ages, backgrounds and abilities to live active and healthy lives. The Council has a key role to play in raising the administration's programmatic priorities, outreach and awareness to improve the health and quality of life of all Americans. The Council's objectives include expanding and encouraging young people's participation in sport and promoting the overall physical fitness, health and nutrition of all Americans; Develop a national strategy to expand children's participation in youth sports, encourage regular physical activity, including active play, and promote good nutrition for all Americans. Focus on children and young people in communities with less than average participation in sport and communities with limited access to sports or recreation areas; Raise awareness of the benefits of participation in sport and regular physical activity and the importance of good nutrition; Promote private and public sector strategies to increase participation in sport, encourage regular physical activity and improve nutrition. Develop metrics to measure youth participation in sports and physical activity to inform actions to improve the participation of young Americans in sports and regular physical activity, and develop a national and local strategy for recruiting volunteers to encourage and support young people's participation in sport and regular physical activity by coaching, mentoring, teaching or managing sports and nutrition programmes. Vision All Americans lead healthy, active lives. Content created by the Deputy Minister of Health (ASH) Content last reviewed on 16 August 2018 Personal mission statements are an important part of leadership and personal development. They force you to think deeply about your life, clarify its purpose and recognize what is really important to you. Personal mission statements also force you to clarify and express as briefly as possible your deepest values and aspirations. It stigmatizes your values and purposes So they become a part of you. Integrating your personal mission statement into weekly planning is also a way to keep your vision constantly in front of you. How to create a personal personal statement and why is it important?: Identify some past successes. These successes can be personal or professional. Recognizing a common theme is useful because it helps you identify what's important to you. Specify your base value. The development of this list should outline a list of features that you believe best recognize who you are, as well as your priorities. After you complete this step, specify which value is most important to you. Some may want to limit the list to a few values before you select just one. Identify your bet. Make a list of ways you feel like you could make a difference. How do you think you can make a difference in the world? Your family? Your employer? Your community? Friend? Seeing detailed bets can help you understand best how you want to make a difference. Identify your goals. Think about your priorities in life and your goals for yourself. Listing personal short- and long-term goals is valuable at this point. Write your personal task. This should now be easily completed on the basis of the results of the first four steps. 1. It integrates who you are. 3. Simplify decision-making processes. 4.Hold you responsible for your decisions and actions. Writing a personal mission statement is finding yourself that can help us reveal things we may not have known otherwise before. Personal mission statements allow us to get to know ourselves better and find our sense of meaning in life. Start yours this weekend. The National Institute for Diabetes, Digestive and Kidney Diseases (NIDDK) is responsible for implementing and supporting medical research and research training, as well as disseminating science-based information on diabetes and other endocrine and metabolic diseases. gastrointestinal diseases, nutritional disorders and obesity; and kidney, urological and haematological diseases to improve people's health and quality of life. Vision Message from Griffin P. Rodgers, M.D., M.A.C.P., Director of the NIDDK NIDDK, I would like to emphasize the Institute's commitment to vigorous, multi-step research efforts. In particular, I would like to answer two questions that have been put to me during meetings with NIDDK constituency groups: how is the NIDDK investigation going now and in the future? How does the Institute respond to the challenges of the current budgetary environment? It is clear that at all levels of the NIDDK organization, we will continue the most convincing research to combat many debilitating and costly chronic diseases in our mission: diabetes and other endocrine and metabolic diseases, liver and other digestive diseases, nutritional disorders, obesity, kidney and urological diseases and haematological diseases. Also remain strongly committed to basic, transnational and clinical research; Research Research and career development; dissemination of health information to improve the lives of patients, their families and those at risk of these diseases. The careful management of public funds is crucial to all our efforts. At NIDDK, we build on emerging opportunities that have gone down the fruits of research investment. Through careful planning and analysis, we are responding to the challenge of using our valuable budget funds most efficiently and efficiently to maintain research power and research achievements. In order to move the research forward, several general principles guide my leadership and the leadership of NIDDK division leaders. Maintain an energetic research portfolio launched by a researcher: The innovativeness and problem solving of individual researchers are crucial to the progress of research. For this reason, NIDDK will maintain funding for the grant initiated by the researchers at the highest possible level. We also maximise our investment by supporting many science that can be widely applied to many disease-specific research issues. Examples can be identified of biomarkers that can help diagnose the disease and assess new treatments in clinical trials; development of cell-based therapeutic approaches to repair damaged tissues; and the use of cutting-level research methods, such as high production rate analysis, to identify new candidate medicines. Support for pivotal clinical trials and studies: Clinical trials will continue to be an integral part of research that examines the wide range of diseases for which the NIDDK has research responsibilities. With many of these diseases disproportionately affecting women, minorities and underrepresented populations, we continue to seek views and answers on health inequities and ensure the significant representation and participation of these populations in clinical trials relevant to these diseases. We aim for precision medicine, which allows doctors and researchers to predict more accurately which treatment and prevention strategies work in which groups of people. We are also further expanding the investigative community's access to valuable research resources accumulated in our large clinical trials by funding accompanying studies related to these studies and supporting a centralized archive of biological materials from clinical trials. Promote a steady and diverse group of talented new researchers: The ideas and fresh perspectives of new researchers will rejuvenate the research community. We therefore support efforts to get new researchers from all backgrounds, including women, minority populations and underrepresented populations, on a biomedical research career. We aim to ensure that new researchers can understand their potential to promote biomedical research and that today's considers research to be a viable career. We promote mentoring of new researchers and promote special consideration of funding for talented new and early stage researchers. Promote exceptional research training and mentoring opportunities: maintaining an NIDDK-focused pipeline of excellent and versatile researchers is crucial to the progress of our research. We will continue to support significant opportunities at postgraduate and postdoctoral level, as well as through research career development awards and undergraduate study opportunities. To ensure that we use our research training resources most productively, we analyze the data to identify the most effective aspects of training programs so that we can share them with our entire community. Ensure the dissemination of information through information and communication services: We translate science-based information from NIDDK-funded research into plain language and strive to share it effectively and widely with health professionals and the public for the direct benefit of patients and their families. We answer questions from the public through the NIDDK Health Information Center and work with organizations to spread the reach of targeted awareness messages and tools. As we plan for the future, we will continue to seek and appreciate outside input from researchers, professional scientific organizations, patient advocates and the public. Other key sources of contributions remain our National Advisory Council, inter-agency coordination committees, strategic planning processes, ad hoc planning teams, and scientific conferences and workshops. This input provides useful scientific guides as we plan future research. Active cooperation with other NIH components and other federal agencies will also remain the cornerstone of NIDDK's design efforts. Increasing knowledge and the introduction of new technologies bring new scientific opportunities for alleviating and overcoming many chronic diseases in the NIDDK mission. Our continuing aim is to seize these opportunities and maximise them in order to reduce the burden of disease and improve public health. To this end, I look forward to working with many NIDDK stakeholders now and in the future. Future.
