The elegant, breakthrough design brings the fog closer to the user. Innovative on/off oscillating head: Choose a 120" motor oscillation. You can find useful customer reviews and reviews for the HoMedics Cool Mist ultrasonic humidifier Amazon.com. Read users' honest and unbiased product reviews. HoMedics Service Center for inspection and repair. Cool Mist ultrasonic humidifier. The tank turns on and the power is turned off, indicating to the user. Blow the cold fog, but after about 20 minutes the fog will warm up. It's not as hot as a warm humidifier (also known as steam), but the fog is warm. I was able to get the cool humidifiers to make white powder, and it's not just that. However, this homedics humidifier comes with a demineralization cartridge. Advertising (1) Dollar dollars, the most effective filter technology available when compared to other filter technologies listed in the 2012 Directory of Certified Portable Electric Room Cleaners when comparing advertised powder CADR retail price of air purification products available at national mass retail (brick and mortar) as of June 11, 2012.1011 Cleaning and CareCAUTION: Before cleaning the unit, turn off the mains current and disconnect unit from the outlet. About White DustUse high mineral hard water to cause the white mineral residue to accumulate on the room surface near the humidifier. Mineral residue is often called white powder. The higher the mineral content (the heavier the water), the greater the potential for white powder. White powder is not caused by a defect in the humidifier, but only because of minerals suspended in water. Demineralization cartridge The HoMedics demineralization cartridge helps reduce the possibility of white powder, minerals left behind by the use of hard water in the humidifier. The cartridge must be replaced from 30-40 fillings. The cartridge may need to be replaced more often if you are using very hard water. When the cartridge needs to be replaced, white dust is formed around the humidifier. If white residue is still produced around the humidifier after inserting the new cartridge, please make sure that the water used is untreated. If you live in hard water, it is recommended to use distilled water for better results of the humidifier. Do not use with a water softener. Install the instructions1. from the package and allow to soak in water for 10 minutes.2. To release the container from the device, place your fingers with your palm upwards into the reset of the tank handle. Press the release button of the container with your thumb. (Figure 3) 3. Place 1 demineralization cartridge on the column and in the corresponding opening of the humidifier base. (Figure 11) 4. Replace the container on the pedestal. (Figure 8) 5. Push the tank handle into the bottom of the humidifier. You will know that the tank is fixed in place when the locking mechanism clicks and the release button of the tank is in an elevated position. (Fig. 9) Tank cleaning Remove the tank from the base by placing your fingers with your palms up into the reel of the tank handle. Press the release button of the tank with your thumb and lift and remove the water tank. Unscrep the tank cap; wipe the container with a soft cloth, then wash it with clean water. Recommendation: Clean the water tank once every two to three weeks, depending on the water conditions. Ultrasonic nebulizer cleaning A small amount of mild dishwashing detergent on the surface of the ultrasonic nebulizer, then pour some water and soak for 5 minutes. Use a brush to clean it with a soft bristle brush (not included) and rinse. Surface cleans Clean the surface of the appliance with a clean, damp, soft cloth. Figure 10, figure 11. Instead of dispersing moisture in the form of steam, these devices use a built-in fan to blow air through a wet filter – it forms a vapor with a mixture of water and air that the fan blows into the air. Because humidifiers are designed to use tap water, bacteria and mineral deposits can accumulate over time. It is important to clean the cold humidifier regularly to keep it in good condition. Turn off the humidifier and unplug the power cord. Place the humidifier in a well-lit work area near the sink and water tap. Wipe the outside of the appliance with a clean, dry cloth. Wash and dry your hands thoroughly before continuing. Remove the upper housing and water tank from the base of the humidifier. Empty the contents of the water tank into the sink. Fill the tank with about a gallon of water. Add a teaspoon of bleach to the water. Allow the solution to sit in the container for about 20 minutes – cover the opening and shake the container every two to three minutes to thoroughly disinfect the interior. Pour out the cleaning solution and rinse the inside of the container with cold water. Repeat the disinfection process with the water basin of the humidifier. Fill the base of the humidifier with undiluted white vinegar – allow the vinegar to sit for about 20 minutes. If the humidifier is equipped with a separate recording tube, place the tube in a bowl of undiluted vinegar and let it sit for the same amount of time. Use a clean cloth or small brush to wipe the limescale deposits from the side of the base. Pour out the vinegar and rinse the base with cold water – if any, rinse the pick-up tube as well. Use clean cloth to wipe away the remaining moisture. Refill the water tank and replace it with the humidifier base. Replace the upper house. Put the humidifier back in its original position and reconnect the power cord. Empty the water tank after turning off the humidifier. Leaving the container full and unused provides the right environment for bacteria to grow. Before handling the humidifier power cord, make sure that your hands are completely dry. Avoid any water getting into the upper house of the humidifier. If this happens, pull out the water and let the house dry completely before trying to use the humidifier again.
