I bought my Fluke at Grainger, i use it to work on my car,test things at my work,minor stuff, i have a 115,i love it to death,when you use a Fluke you just feel the quality in your hands,sometimes ill leave it at home and i have to borrow one at work from someone , usually a cheapie and man , sometimes I have to travel home and get that bad guy, lol, rated 5 out of 5 by LSD25 from Fluke I have 115 men my right hand! I'm a TV repair technician and my Fluke 115 goes everywhere with me. It's durable and accurate with a great good easy to see digital readout. It's paid for itself for what it does to save me valuable time in this area. Thanks to all the engineers in Fluke! Rated 5 out of 5 by elpato from Great Overall bought it a year ago and couldn't be happier with it. It works great, it's very responsive and very durable! I use it at work for all machines but also make it home and have wire fixtures, lights, outputs. It's just a great product. Rated 5 out of 5 by TJ Comp from Large across the DMM this is a few great digital yards. I am a master mechanic and at home also use it for some house. So it works great for DC and AC. I actually went from a similar mutko and I'll never come back. We go with the money a lot of great features as well. I really love the light after light, you'll find that in a lot of DMM. We are with money and far more accurate than any other brand including Matco and Craftsman. For every technology today I just picked up a few yards from me and it didn't work. I turn it on and after a minute it automatically goes off. I tried to do it a few times but it repeated the same behavior. I get a little worried at first because I like my gadgets and electronic components. Soon I'll be doing some Google searches, which have drained the battery. i have to change thetrid . But I didn't know how to change the battery of a multimeter. I learned and decided to write about my experience so that if anyone had the same problem. It will be useful. I hope you enjoy this article. To say if the battery has been drained when I saw a few yards I didn't work I had a lot of false thoughts on my mind. I thought, maybe the fuse was burned, maybe the whole multimeter was burned. But then I realize that if the fuse or multimeter is burned, the screen shouldn't show anything. All these false thoughts came to my mind because the first time I pressed the power button on the multimeter, nothing showed. Then after pressing it a few times, it's been a few yards but it shuts down automatically in a minute. I think the sign of battery drain is that when you turn on within a few yards of yourself, it stays on. And then maybe it'll shut down all of a sudden without your intentions if you have the same problem, so don't worry. thats not a big deal . You just need to replace the battery, how to change the battery of a multimeter,

you're sure your multimeter battery has been drained. And they have decided to change that. Let me follow the steps below and you just do fine. To change the battery a few yards all you need is a screwdriver and 9V battery from a trusted brand. You should have a screwdriver that fits your few yards, otherwise you won't be able to replace the battery. This is my multi-meter image that didn't work. I was very sad to see him in this situation. I used this for almost 5 years. So I guess there's a love connection. All I'm saying is I just love him, and I can't see it's not working. You see, a few meters from me, there's a good yellow rubber coating around it, and it also gives it a good look. I didn't see me a few meters without a yellow color. It looks pretty good without him but I had to remove it so the whole few yards would work properly again. See the back of your multimeter. There has to be a place where you can feel like a place for batteries. I didn't feel or did not see and I would remove all the screws on my few yards. And guess what, removing Daley's screws was of no use. See if there should be a horizontal line behind your few yards and you have some screws nearby. If I see such lines, remove the screw just near it. Remove all screws. Please carefully take the screws with a good screwdriver. Try to force it open with a screwdriver that doesn't fit it. After removing the coating carefully. It's time to carefully remove the drained battery. The battery may be placed in any position and angle. You have to be very smart and think to handle it carefully. Because we are going to work a few yards we are fine again not to damage it even further. And I think that's the most important part of our main issue, changing the battery of a multimeter. Maybe your damage battery won't be in good shape. If you see some unfamiliar liquid on your battery. Try not to touch it. Hand. I don't know exactly why but I think it's kind of acid and we should avoid it. I think so, you touch it and you accidentally touch your eyes with these dirty hands while working. You may get into trouble so try to keep the battery in good condition. Replacing the old battery with the new one both the old battery and the new battery should have the same specifications. If it doesn't have the same specifications. Your multimeter may not show accurate results of itself. And I think it shouldn't work properly. Make sure the new battery fits in very nicely and properly. If it's not well suited you'll be able to put the back cover on it. Also make sure you attach the right poles of your battery to the right polarity of the multimeter. I don't think that's going to happen because the wires are designed in such a way that you can't make any mistakes. But I thought it would be nice to point out to check if the meter is working well when you change the old battery with the new one. It's good to check your few yards before covering it. Power onto your multimeter and wait for a minute if it's not automatically turned off. that means you did a great job . Your multimeter is good to go for measurements, as one measures voltage, current measurements, etc. Putting the covers and probes back in place once confirmed, it's time to put the lifted back cover back in its original place again. They have also removed yellow protection coverage and probes. We need to get them back to their original places and connect them. And it works fine and also looks good again with a yellow coating on it. One thing I add here if you hold the button on your few yards please check it out. I pushed it accidentally while improving a few yards back. When I finished the cover I powered it a few meters, but when I tried to measure its old battery voltage it was that it didn't show any voltage. The moment was a small concern but very soon I realized the hold button had been pressed. And by sharing what I know about how someone can change the battery a few yards. Your conclusion is turned on a few yards on your own, and suddenly turn it off automatically. This is one of the few-meter battery signs you need to change. I'm sharing this easy method of how to change the battery a few yards. Replacing the battery drained from a few yards with the new one is quite interesting to learn and have fun to do. Now, if you want to buy some batteries online for a few yards of your own, I recommend Duracell Battery (Amazon Link). If you like it, it will be the best product for you. Hopefully somehow it has helped you. Now, if you are someone who would like a full course to learn about the principles of a few yards. Then, I have created an amazing period especially for people just getting into electronics. You will Each concept is about the use of multimeters, multimeter types, how to use a multimeter for resistance, voltages, current measurements, and captains. Not only that you also learn how to use a few meters to troubleshoot the circuit, and much more. Here's the link to the course (a period of principles a few yards for everyone). thank you and have a good life . Life.
