Our outdoor garden tools can take on any task - for a courtyard squirting overgrown into the small tree clipping shape. 1 Lift the mower deck to reveal the blade. It is important to take a closer look at the carbürator and the oil compartment to make sure that you do not tilt the lawnmower dish in such a way that it pours oil all over the engine, grass and yourself. [1] Usually the safest way to do this is to tilt the mower backwards towards the handle and support it with some kind of weight or with the help of a partner. This will not necessarily be true for all mowers, however, so use the decision and, if necessary, consult the owner's manual. It is also best to do this when there is no gas in the mower. Wait until you use them all to replace the blade, or you might consider disloading the gas with a hose. Typically, self-syphon pumps are sold in any hardware or automotive parts store. This prevents gas from spilling on the mower body. 2 Unplug the plug. It is best to stay on the safe side and avoid a short exit or electrical flare-up in contact with any oil or gas plug. It's okay if you keep the mower straight, but it's still best to be on the safe side. [2] 3 Why remove the mounting bolt from the blade. When using your other hand to prevent the blade from turning, use a socket switch of the appropriate size and remove the assembly. [3] Be careful not to lose the washers or mounting equipment that replace the blade and can be re-used. When removing the knife, pay attention to the position of the blade. You can use the new one, usually the sharp edge of the blade, mounted in the same direction, turning counterclockwise with the rotation of the assembly. Again, this may not be true on all mowers, so be careful how you load this knife and install new blades accordingly. 1 Buy a spare knife. Spare blade kits for push mowers are usually only a few dollars in the most home improvement or hardware stores, featuring new pre-weighted and sharpened knives, and often spare nuts. If your blades are particularly worn out, it's a good idea to invest in a new set. Some mowers have a lower cover with two short separate blades attached, while some new push mowers have a single long blade that looks like a ruler. To inspect the blade, lay the mower back or talk to someone at the hardware store about the type of knife your mower is suitable for your brand. If there is, you can also check the user manual. [4] Alternatively, you can recover old knives and sharpen them if they seem to be in good condition. If the blades are worn, take a new set, la with sawdust or parts from metal That would be wise. 2 Mount the new blade In the right direction. Line the blades previously lined up and re-load the crushers and nuts, or use new washes and nuts of the appropriate size. If there is an instruction manual, the nut should have torque properties for tightening. If not, just make sure that the knife, which can cause vibrations in the mower, do not over-tighten and solvent. [5] Most knives are either special or universally adapted. Make sure it has the same length as the old knife before installing the new one, and make sure the clearing from the lawnmower dish deck is the same. Carefully squeeze the new knife into the bolts, because it will be much sharper than before. It's a good idea to wear thick mechanical gloves while doing the job, keeping your hands safe. It is also recommended to use a small piece of wood to prevent it from turning when reloading the knife. To prevent things from turning, you can squeeze a small piece of wood between the knife and the mowing deck. [6] 3 Check the knife for the game. Make sure that the blade is mounted correctly and does not vilicker when you move it up and down, tightly. Remove the jacks or décor used to hold the lawnmower dish in place and wait about 30-60 minutes for the oil to return to the engine to avoid problems or engine damage. Check the oil before using it to make sure it is within the appropriate limits. 4 Refilled the gas chamber and check it in advance before mowing. If necessary, check the air filter and reinsert the spark plug cable to make sure the oil saturates the foam filter. After a quick inspection, you should be able to start your mower and start cutting the grass much more efficiently with your new blades. Add New Question What should I do for a peeled bolt? It depends on the definition of robbed. The head of the bolt or the threads? This bolt can be difficult if you are the head of the bolt, but you want to get out of an EZ and do the job of a drill tap, or a good pair of powerful vice handles and a little heat from the propane torch should also help with bolt lifting. If the threads peeled on the bolt then probably take the bolt to the local hardware tank and get an exact copy of the bolt depending on the yarns (rough, thin or whatever). While I have a 3/8 fine thread on lawn mowing knives, I'm pretty sure. Question Which way should the knife be installed? The sharp edge of the blade should be mounted towards the face of the grass. If the blades have tabs to fit in the body, go ahead and fit the tabs into the body around the shaft. Always wear gloves though (preferably leather). Question What's the best way to remove a lawnmower dish without damaging the lawnmower dish? For more leverage, use a 6-point socket or box key that fits the knife nut and a long extension. The knife must be held between the shroud and the blade with a short piece of wood of 2x4 or Be very careful with the sliding tool from the nut due to the lack of flat open or wedge slippage. Make. What should I do if a knife in my lawnmower can't stop automatically when it's disabled? Buy a new lawnmower dish or take it to someone to have it repaired. That's insecure. Question Should I turn left or right to loosen the nut? Try turning the nut to the left (counterclockwise). If this does not work, then try translating it in another way. Question How do I find the matte and model number of the lawnmower dish without a guide? I would recommend starting with a general online search describing lawn mowing. (For example, the small motor may be searching for a black push mower.) Look at the images that appear and see if you can find one that looks like your mower. Question Should the knife move clockwise or counterclockwise? The blade moves clockwise when the mower is in its normal position (cutting grass). However, when the mower is on the side while working on it, it is needed to turn the knife counterclockwise, in the other direction! Question What should I do if I change my lawn mower and the mower doesn't work? Check the air filter to check if it has any oil, check the oil level, check the plugs, but most importantly, make sure the blade spins. Question How do I remove the rust nut from my lawn mower? Use steel wool to remove rust from your lawn mowing knife and polish it with WD40. Ask a question is a wiki similar to wikiHowWikipedia, which means that most of our articles are written together by multiple authors.
